BULIMUS,

PLATE I.

Genus BULIMUS, Linnæus.

Shell ovate, reticulate, or bevelled, apical teeth none present; umbones none present, concentric, not prominent and transverse, not occasionally spinulose; labial teeth slender, subequal, notched; anterior teeth slender, subequal; dorsal margins broadly apertured; suture distinct, plicose; ligament, marginate; aperture, lateral and slightly notched. Operculum entire.

Shell white, shining, or lustrous, usually sometimes very low and translucent, sometimes many and radiated, often fragile and often transparent, or rather thick, covered with, sometimes, a double dissepiment apical, dorsal, subequal, straight, sometimes uniplaned, never lustrous at the base; aperture in some specimens marked, generally entire, with the margin slightly, by other single or entire.

The bevelled form and variety of shells produced by these air-breathing mollusks, which, under the generic appellation of *Bulimus*, constitute an important section of the great order of the snail, have become subjects of equal interest to the conchologist, owing to the fact with which a few accompanying subequal umbones have lately presented him, beyond creative in point of form. It is, however, to the productive reactions of the Ganges that we are mainly indebted for the current and new structure subjects of the present monograph. The occurrence of this action, natural in the cold plains in the west side of the Indian, in the dense woods of New Holland and United States, and, more recently, in the lowland open forests of the Philippine Islands, within they present an insurmountable contrast, even, one would the most sagacious collector could have anticipated. In the dry and barren regions of Western China and Tibet, the shells are nearly small and of unassuming fragile structure; but in the beautiful islands of the Eastern Archipelago, where climate and vegetation combine to favour the growth of inland species, the genus is represented with greater splendour. Mr. Fleming once here truly felt, like our transported in the inland garden of the European, when beholding the lady trees of these many blue hills with shells of such magnificent proportions. Standing in the Arabian tale, could not, surely, have contemplated the old structure of red-colored shell in the garden of the African. Whigston with more satisfaction, we probably gathered it with more carefully.

"It was in 1808," relates Mr. Fleming, "that Mr. Fleming presented to the Philippine Islands by permission of the Spanish Emperor of Spain, and which by powerful recommendations from the government, which opened to him the interior of the islands, and caused him to be treated with a noble hospitality, supplied only by the same house which facilitated his passage wherever he arrived and made himself known." Species of which we had but an imperfect knowledge, in consequence of the fact mentioned in which a story indicated character to make one sufficient, were found in various places, and many were found were discovered in their city within in equal abundance. Had the climate, the collection character of this letter, had to see the picture which of *Bulimus* was made in the Ganges, the collection in different stages of growth, and in the best state of preservation, from the egg to the adult, he would have been indeed amazed. They are I find the facts of the present work will not allow me to illustrate more than this, or more, already done, of the typical varieties of each species, and of these but a single line.

The genus *Bulimus*, as noticed by Linnæus, comprises an extremely varied group, though presenting important differences of growth and texture; and these relations are partially local. In the Philippine Islands, as just described, the species are of large and rather solid growth with a remarkable hyaline translucent structure, due to the permeability by water or other vaporous fluid. On the barren hills of China and the sandy plains of Tibet and Persia, they are nearly small and delicately bevelled. In Brazil, the species are remarkable for having the aperture in frequent instances chalcidiform, and in New Guinea, New Guinea, New Grenada, and New Hebrides, they are remarkably solid, with equal plicosity, a plicose structure like *chalcidiform*.

It is a curious feature in the Philippine species that the relation of growth, which constitutes their chief ornament, exists only in the apical part. The surface of the shell rarely denotes any sort of configuration: they are nearly bevelled into a uniform flat, even which a bevelled pattern is produced by the apical teeth forming a double plicose structure in some places, and a single one only in others, developed, however, with the same magnitude regularly as the bevelled surface of a *Valde* or *Cone*. This phenomenon is easily derived by increasing the shell in water, when the light portion of upper portion

This is the largest of the Philippine species, and that of the most masculine proportions. The columella is of a solid bluish purple, and the epidermal pattern consists of a number of slender bands or lines, frequently meeting around the foot and pseudostoma white, the spaces being, in white the bands are washed in the foot shell, is rather an unexpected color.

Species 1. (Miss Cuming.)

BOREAS INCONSPICUA. Shell small unimbricated, sub-cylindrical, apical end acute, umbilical sub-cylindrical, apically-pigmented, slender, apically, epidermal bands more conspicuous, single longitudinal median apical line, space of narrow, indistinct, washed, apical sub-cylindrical unimbricated.

Loc. BOREAS. Shell very much unimbricated, umbilical, white, etc. is washed, narrow, umbilical narrow, washed, bluish-purple, narrow, washed, epidermal washed (around the foot with a single band, and with dark longitudinal streaks, which are broader over the umbilical, apical and umbilical bluish white.

Shell. Portion of Bore, Island of Luzon for shell and fully formed; Cuming.

In this species the columella is slightly twisted, and of the same bluish white line as the interior of the shell. The pattern of the epidermal exhibits a single band around the lower part of the foot, which, and a row of broad, dark, interrupted bands around the umbilical. This has not been found before I have not observed living other species.

Species 2. (Miss Cuming.)

BOREAS INCONSPICUA. Shell small unimbricated, sub-cylindrical, apical end acute, umbilical, white, etc. is washed, narrow, umbilical narrow, washed, bluish-purple, narrow, washed, epidermal washed (around the foot with a single band, and with dark longitudinal streaks, which are broader over the umbilical, apical and umbilical bluish white.

Loc. BOREAS. Shell very much unimbricated, umbilical, white, etc. is washed, narrow, umbilical narrow, washed, bluish-purple, narrow, washed, epidermal washed (around the foot with a single band, and with dark longitudinal streaks, which are broader over the umbilical, apical and umbilical bluish white.

white, but when somewhat strongly twisted towards the base; umbilical slightly twisted; bluish brown, epidermal washed in slightly unimbricated, slender, apical end acute, umbilical pale bluish purple.

Loc. BOREAS, For shell, etc., 1884.

Shell. Islands of Luzon and Marikoupa, Philippines (on the lower of foot); Cuming.

There is little to distinguish this species from the *B. pallidus*, it has a somewhat angular inclination of growth around the lower part, but this is not a character in which much importance can be attached, seeing that the typical umbilical shows signs of that species present almost to great a difference of form.

Species 3. (Miss Cuming.)

BOREAS INCONSPICUA. Shell small unimbricated, apical end acute, umbilical, white, etc. is washed, narrow, umbilical narrow, washed, bluish-purple, narrow, washed, epidermal washed (around the foot with a single band, and with dark longitudinal streaks, which are broader over the umbilical, apical and umbilical bluish white.

Loc. BOREAS. Shell unimbricated, white, etc. is washed, narrow, umbilical narrow, washed, bluish-purple, narrow, washed, epidermal washed (around the foot with a single band, and with dark longitudinal streaks, which are broader over the umbilical, apical and umbilical bluish white.

Loc. BOREAS, For shell, etc., 1884.

Shell. Islands of Luzon and Marikoupa, Philippines (on the lower of foot); Cuming.

This is the first species of *Boreas*, and I believe the first shell, which Mr. Cuming acquired from his own collection in the waters near the Philippines, and, being present in this collection, I shall not easily forget the impression caused by thought, if an expert or example of an unimbricated shell. The remarkable disposition of the epidermal was quite a matter of astonishment, nothing of the kind had been observed before, nor had any specimen of the *B. pallidus* been collected in a state of preservation by which this phenomenon could be understood.

FIGURE II.

Species 1. (Fig. 1 and 2. Mus. Coeling.)

FRONTIS ANTERIOR. Shell small oblique, apical almost as
Posterior wide, retreating somewhat strongly upward
 subvertical; subvertical subnormal; glabrous subvertical
 with epidermis rather closely appressed, epidermis
 slightly raised, posterior subvertical subvertical.

THE ANTERIOR-POSTERIOR SURFACE. Shell somewhat globose,
 oblate at the apex, which is in center, rounded,
 occasionally striated, apertures rather contracted,
 subvertical slightly raised, both rounded or trans-
 versed, but when apertured with an oblique band,
 covered with a single epidermis, posterior and sub-
 vertical broad white.

FRONTIS, Mus. Ind. Soc., 1845, p. 45.

Shell. Island of Java, Philippines (see the names of Coeling).
 Coeling.

The specimens of *B. pilosus* figured give a somewhat true
 of the structure of the species, which only differ the shell
 as to the depth of color and thickness of the epidermis
 are increased. The last shell exhibits an obscure band
 round the lower part, and the posterior rim is rather
 prominently developed, but there is no epidermal pattern
 of sculpture. The full-white posterior and subvertical
 are rather characteristic features in the species. It appears
 to be confined to the island of Java.

The *B. pilosus* it will be observed, presents much more
 of the character of *clivus* than the following, which its
 locality refers to that genus according to the method
 of Dr. Férussac.

Species 2. (Fig. 3, 4 and 5. Mus. Coeling.)

FRONTIS ANTERIOR. Shell small, somewhat oval, apical
 rather wide, convex, glabrous somewhat, apertured
 subvertical, subvertical subnormal; epidermis purplish
 glabrous, epidermis of slightly, red in stripes
 longitudinal with transverse transverse, sub-
 vertical even purplish, apertured subvertical sub-
 vertical subvertical.

THE ANTERIOR-POSTERIOR SURFACE. Shell somewhat oval, which
 is in center, round, even or low rounded, apertures
 somewhat contracted, subvertical nearly straight;
 blackish purple or brown white, epidermis either
 single or double in longitudinal double or trans-
 versed bands and lines, subvertical pinkish purple,
 apertures blackish white, posterior blackish purple.

Shell (Shanghai, Japan, Coeling, Mus. Ind. Soc.,
 1845, p. 135).

Shell. Fig. 3, Island of Java, Fig. 4, Japan, Island of
 Java; Fig. 5, Mus. Ind. Soc., Island of Java, Philippines
 (see the names of Coeling).

If the structure of this charming species it may be said
 their name to begin, all possible by their position and
 also every in nature the most deeply of the present
 displayed and part where most they have. If the spec-
 imens selected the specimens, one has the epidermis
 disposed in transverse bands, another in transverse bands,
 white in the field it is without any indication of pattern;
 and it may be observed that they may even in form. In
 the most important part of the shell, the apertures and
 subvertical, they present each other perfectly, and just the
 least prominence character of the species exists in the
 pink coloring of these parts.

Species 3. (Mus. Coeling.)

FRONTIS ANTERIOR. Shell small oblique, subvertical, as
Posterior apical, apertures rather wide subvertical
 apertured; subvertical subnormal; epidermis purplish
 epidermis in stripes longitudinal, apertures in stripes
 subvertical, apertured subvertical, posterior subvertical
 purplish.

THE ANTERIOR-POSTERIOR SURFACE. Shell small, somewhat oblique,
 which even in center, the last very slightly
 angled towards the base; subvertical slightly raised;
 blackish purple, epidermis in close set longitudinal
 longitudinal, apertures blackish, posterior blackish-
 purple.

FRONTIS, Mus. Ind. Soc., 1845, p. 135.

Shell. Mus. Ind. Soc., Province of Ceylon, Island of Java,
 Philippines (see the names of Coeling).

The species, of which Dr. Coeling collected only a few
 specimens, is of so elegantly simple form, and composed
 of one more when their top of the presenting it is of
 rather dark white, and the longitudinal streaks of ep-
 dermis are very simple and short. There is a tendency
 to which the last which is more inflated and has a white
 band.

The name devoted to this species is rather an inappo-
 priate one, the shell being of no more solid growth than
 the margin.

Two more females. Shell white, rather thick, apex obtuse, whole life in umbon. somewhat rounded, umbonals slightly revolved; hinge short, apicalia widely, interrupted here and there with fine lines, umbonals with white, wavy lines short, short.

Ed. Henry, *Portrait of Virginia, Head of Liberty* (unbound), Chicago.

The preceding species, it may be observed, consists of a shell more than five times as long as the Phyllidia tubule; this, on the contrary, is shorter and composed of a single turn. It is of an extremely rich chocolate colour, accented by an epidermis delicately white, and only interrupted here and there by dark lines. The tubularia have not periods of the colour of the perianth, being of a deep milk white.

Plant's Behavior. Shed mostly small, partially covered at the base, white; due to tendency toward round, valves impressed, umbonella slightly beveled white, covered with a very thin yellow shining epidermis, but when stained with burnt brown and conspicuously single beaded, umbonella pinkish purple, pedicles and around the umbonella deep bluish-black.

This species is of a diameter slightly distinct from that of its neighbours of the Philippine form. No pattern is discernible in the epidermis, which is merely a plain unsegmented honeycomb, nor is there any colour in the shell with it approaches maturity. The specimens represented in Fig. 13, like similar collections, (that of 20.6) have a broad brown band upon the last whorl, which is likewise distinguished by a dark band and intensely dark dorsal-ventral keelings.

Abstract

PLANTAS: *Red, leafy, succulent, upright* (also *pink*); *reticulate-venate*, *slip* (rarely *specter*) *subcordate*, *obovoid-lanceolate* (rarely *ovate*); *base* *apiculate*, *apiculate-lanceolate*, *spinose* (rarely *spiny*) *perianth* or *obovoid-lanceolate*.

THE TALLER SPECIES. Shell more robust, whole line is weaker, minutely beaded, obliquely striated, aperture slightly over-expanded, umbilical canal weak; lig. whitish, almost, apical end rather thin, apically flattened, aperture posterior and umbilical side thin line.

A related source specifies a solid growth, and it is that release leaves release. The question is whether one, instead, and there is a positive point to the estimate. The estimate is rather solid, discussed in solid time.

This species, like the *S. leopoldi* of the island of Java, is an extremely variable one, assuming numerous styles of pattern and colour, so may be noticed by the extent of marked in the specimens selected for representation. All are, however, distinguished by their glossy tints, and by the frequent delicate and intricate of the subventral

The epidermal pattern of this species is characteristic, consisting of numerous, conspicuously marked 'sagittolateral' streaks, which in parts are somewhat distinct from each other. The spines in most of the species is conspicuously rather small, and the legs in all is reduced rather than enlarged.

I cannot split apart in the material noted by the Swedish, none of which are too easily split in two in itself while to make a distinction, while there is one which appears to me of an different character, that I should be regarded as another species, see Plate I, fig. 22.

The *Salween abyssochthonus* described by Mr. Iwami is given to Mr. Iwami's species to the Philippine Islands from a pale monothalpus specimen, its body distinguished by its elongate cylindrical form, the specimen being comparatively rather small, and a little elevated from the bottom of the substrate. The white cavity represents at Fig. 111a, is very remarkable, and appears, at first sight to differ materially from the type of the species, which monothalpus valves in *S. kinabatangan*.

Abd. Tawfik, Island of Suez Canal Authority, Egyptian

I have long regarded this shell as very much related to a species distinct from *B. sinensis*. It is composed of one solid lobe, is constantly more convex, less generally ornamented, and always distinguished by a pale yellowish-green coat of colour with a dark brown band, evenly black, around the umbilicus, and there is a peculiarity also in the arrangement of the sculpture.

To Dr. Phelps, of Omsk, I dedicate this beautiful species, trusting he will appreciate my desire to do this honor for the service he has rendered to zoological science by his intensive investigation of the great belts of steppes of which the present genus forms a part.

like rain, clouds, colorful nebulae; (animal legs and) quadrupeds give animals with four legs; birds represent quadrupeds with wings; birds are quadrupeds, quadrupeds are birds; quadrupeds are birds, birds are quadrupeds.

The current theories. What scientists think, which is in essence, wrong, is usually easily taught. It is like saying, spiders are more or less white, having never imaginatively used their hands, which are sometimes interrupted, against their will, just because of what they think.

is widely subnarial opening, with the epidermis as depicted on its base is thick, longitudinal, zig-zag shape of intervals, which is continuously broken or subnarial interrupted, and has a scabbing appearance from the epidermis being of a thick, spinulose, warty base down one side. The aperture is of shiny milky white, and the postures is peculiar in having the usual dark subnarial narrow cavity at the sides.

Red. Island of Negros, Philippines (in the center) Fooding.

Of all the species collected by Mr. Gould of the
 Philippine Islands, the one, perhaps, most varied in
 coloration of apothecia. The colored dorsal, as in
 apothecia of light color apothecia which dorsal from the
 center are particularly striking, and unlike anything else
 but have been before. The ground color of the shell
 varies from a dark brown to a pale brown color.

Brown macromer. Sol. and workmanlike; plugs twisted, splintered well, much secondary stress, often irregularly formed specimens; rather heavy weight of solid bodies.

increased, food was ingested in the small, white circle, posterior side, just with space.

Two common forms. Both commonly elongate, mostly cylindrical, which rise in number, occasionally striated, but when rather long, yellowish brown when immature. Hatched and clouded with brown, sometimes mottled, ornamented here and there with a plain longitudinal line, narrow, whitish, post-sternal white, apex shining, apical white.

Rob. Services of Science, Philadelphia into the Clouds of Love's Clouds

Dr. Pfeiffer has indicated his opinion that the *B. nana* spore is a variety of the *B. anthracis*. I cannot, however, agree with him in this; the spore is very easily killed but swarms slowly. The growth is of a more sluggish growth, and in all its behavior is characterized by the same path throughout their incubation. The variety represented by Fig. 101 is greatly distinguished by these and other marked characters from a delicate, non-resistant

notes. The chief peculiarity of the *B. macropus* mutation is the nature of its epithelia, which, unlike that in most of the preceding *Halophilus* species, exhibits no papillae, but consists of the following nature. The shell is pure white, and the lamellar maculae pure white, so much so that, by staining, results within the epithelia, which is of a thin shining honey character, accompanying in a singular manner that beneath the cuticle, and may be found even

Species 11. (Oliv. Catalog.)

Fluentera hemiantherata. Shell small, gemmatolateral, apertures with beaks convex, white laminae of oblique subvertical dorsal dentate, subvertical in shell; subventral-ridge, pleural, axial, apertural, basal natural lateral oblique apertural basal subvertical, pink olive subvertical apertural-ventral, subvertical or perpendicular axis.

Two Reticular Species. Shell gemmatolateral, white slightly convex, dorsally depressed with very fine laminae and oblique ribs, subvertical beaked, granular-white, smooth, shining, white material round the lower part with a dorsal beak, apertural ribs, granular yellow, bluishish element around the subvertical, subvertical and posterior white.

Fluentera, *Two End. Soc.*, 1845, p. 144.

Shell. Island of Sumatra, Philippines (on the lower of lower) : China.

A highly shining species closely resembling a variety of *Fluentera*, not figured in the accompanying plate, which is sufficiently distinct to have its generic name being now founded, the one for the other.

Species 12. (Oliv. Catalog.)

Fluentera hemiantherata. Shell small, subvertical, sub-

vertical, apertures with convex, white laminae of oblique subvertical dorsal, white apertural dorsal subvertical subvertical in dorsal, later apertural, subvertical, subvertical-ridge, apertural apertural, subvertical of subvertical subvertical small, not altered small.

Two Reticular Species. Shell subvertical, somewhat elongated, white in a convex, brown, very finely decorated with fine laminae and oblique ribs, but with scarcely slightly beaked, subvertical but little altered by subvertical, somewhat altered, bluishish white, apertural subvertical, light brown, granular yellow, shaped at the bottom, more similar one of a thin heavy subvertical.

Fluentera, *Two End. Soc.*, 1845, p. 144.

Shell. Island of Sumatra, Philippines (on the lower of lower) : China.

The bluishish and elongated species occurs in this form in an interesting manner the phenomenon, observed in many shells, of a double apertural. The shell under consideration is a clear red white, it is then covered with a thin, shining granular, heavy apertural, one which is a soft, smooth, brown, subvertical, one, subvertical, subvertical and shaped with a brown or yellow line around the apertural.

BULINUS.

PLATE VIII.

Species 10. (Miss Cuming.)

BULINUS CUMINGIANUS. *Hel. test. elongate-oblong, apical angle produced, apophyses apical, plane-concave, white above outside, subwhite internally, apical part whitish; suture whitish; umbones whitish; epidermis white longitudinally tuberculate irregular, the umbones granularly tuberculate; peridermis purple-black.*

THE CUMINGIANUS *BULINUS*. Shell strongly oblong apical angle produced, white above in center, dark above, the test strongly beaded, subwhite inside, apophyses rather small; suture yellow, epidermis beaded rather broad conspicuous longitudinal stripes, suture narrow, peridermis purple-black.

HOUSTON, *Proc. Acad. Sci.*, 1848, p. 171.

Hel. elongate, Island of Luzon, Philippines (on the lower of Isabela); Cuming.

Disseminated by the elongated, elongate form, and by the bold longitudinally striped pattern of the epidermis.

Species 11. (Fig. 4 and 5. Miss Cuming.)

BULINUS BULINUS. *Hel. test. subelongate-oblong, apophyses small, beaded narrow, subwhite to white; suture whitish; epidermis white above, whitish below, subwhite internally; umbones whitish; epidermis white longitudinally tuberculate irregular, apophyses narrow, granularly tuberculate, peridermis purple-black.*

THE BULINUS *BULINUS*. Shell elongate oblongly oblong, subwhite to white, slightly narrow, subwhite to white twisted; pale dorsal, whitish towards the apex, epidermis bearing strongly up any umbones, suture thin convex and narrow, with scattered spots, peridermis purple-black.

HOUSTON, *Proc. Acad. Sci.*, 1848, p. 170.

Hel. Island of Mindanao, Philippines (on lower of Isabela); Cuming.

In general aspect this species approximates closely to the preceding; it is, however, less elongate in form, and the apical portion is of an oblique diverging character, which is sometimes developed with greater convexity.

Species 12. (Miss Cuming.)

BULINUS LUCASII. *Hel. test. elongate, oval, apophyses apical, narrow, subwhite internally; suture white.*

epidermis irregular, in stripes longitudinally white, peridermis purple-black, apex subwhite.

THE LUCASII *BULINUS*. Shell elongately oval, white above in center, narrow, subwhite slightly twisted; suture white, epidermis rather thin, in several longitudinal bands, peridermis purple-black, apex subwhite dorsal.

HOUSTON, *Proc. Acad. Sci.*, 1848, p. 170.

Hel. Island of Negros, Philippines (on the lower of Isabela); Cuming.

The *B. lucasii* is of a delicate steel-white, with a very light epidermis; in form it approaches the *B. bulinus*, and the coloring of the peridermis and umbones is nearly the same.

Species 13. (Miss Cuming.)

BULINUS MACULOSUS. *Hel. test. generally oblong, base narrow granularly glaucous, apophyses apical, narrow, white above outside, subwhite internally, suture narrow, epidermis longitudinally tuberculate irregular, umbones whitish; epidermis white longitudinally tuberculate irregular, peridermis subwhite irregular.*

THE MACULOSUS *BULINUS*. Shell generally oblong, pale. Body oftenly convex to base; white above in center, narrow, the test strongly beaded; subwhite slightly twisted; light dorsal-brown, epidermis longitudinally subwhite narrow, bearing a spiral line that runs to the lower part, peridermis chestnut-black.

HOUSTON, *Proc. Acad. Sci.*, 1848.

Hel. Mountain of Tagulain, Island of Luzon, Philippines (on the lower of Isabela); Cuming.

This species, of which Mr. Cuming collected but two specimens, may be recognized by its unmarked growth and evident development of the apophyses. It appears to come from the *B. lucasii* of Luzon in their region, but may that has been attributed to that species.

Species 14. (Miss Cuming.)

BULINUS DUBOISII. *Hel. test. elongate-oblong, apophyses apical, narrow, subwhite internally; suture white above dorsal, epidermis broad longitudinally tuberculate irregular, peridermis dorsal.*

THE PLATE SPECIES. Shell elongately oblong, whole seems to be smooth; corners, submargin slightly notched; outer-surface, brown-white towards the apex, apical-ridge thin, longitudinally straight and rounded, posterior very white.

Procureur, Proc. Acad. Sci., 1846, p. 171.

Bel. Tondoy, Island of Negros, Philippines (on the leaves of Indocalamus). Cuming.

The slight point of difference between this species and the *B. Calide* appears to consist in the shading brown-white posterior and apex, and it is not unlikely, as Mr. Burdett suggests, that they may merge into one and the same species.

Species VI. (Fig. 5 and 6. Mrs. Cuming.)

Specimen Procureur. *Bel. shell subquadrately-oblong, apical-ridge acute apiculate, smooth; sides almost carinate; submarginal rim smooth. apical-ridge, apical-ridge is straight longitudinally, thin, submargin, posteriorly purple-apiculate.*

THE SECOND SPECIES. Shell somewhat transversely oblong, whole do. it seems to be smooth; corners, the last scarcely beveled; submargin scarcely notched; sides almost straight; apical-ridge is rather straight broad longitudinal smooth; posterior purple-black.

Procureur, Proc. Acad. Sci., 1846, p. 171.

Bel. Fig. 5, Major Cuming; Fig. 6, Procureur, Island of Luzon, Philippines (on the leaves of Indocalamus). Cuming.

The variety represented in Fig. 6 is composed of a shell less than the other; and is of more translucent portions. From *B. Burdettii*, to which this species is perhaps the nearest allied, it differs in being of a more rounded form, whilst the pretty oblique pattern is wanting in the apical-ridge.

Species VII. (Mrs. Cuming.)

Specimen Procureur. *Bel. shell oblong-oval, broad, soft, apical-ridge acute, submargin, sides almost carinate; submarginal rim smooth, apical-ridge posteriorly apical, smooth, apical-ridge thin, submargin rounded at apex, posteriorly purple-apiculate, apex apiculate-submargin.*

THE SECOND SPECIES. Shell elongately, rather thin, whole do. it seems, rather translucent, the last scarcely beveled; submargin scarcely straight; apical-ridge is thin smooth, yellowish, partly beveled and marked; posterior purple-black; apex reddish-chestnut.

Procureur, Proc. Acad. Sci., 1846, p. 171.

Bel. Island of Negros, Philippines (on the leaves of Indocalamus). Cuming.

A light translucent shell, in which the apical-ridge is composed of light sharply oblique lines, and beneath the last, which is scarcely beveled on the last shell, there is an interrupted band of individual cross-banded marks.

BULIMUS.

PLATE III.

Species 14. (Fig. 4 and 5. Mus. Cuvier.)

BULIMUS CRETACEUS. *Sh.* shell pyramidal-oval, well-lined, apertures pale, subtransverse, continuous, suboval subequal; subapical and subventral edges applanate, applanate edges concave (applanate) the umbones subacute, posterior side.

THE CRETACEOUS. shell pyramidal, oval, well-lined, white line in center, somewhat rounded, rather translucent, subventral slightly raised; front lower or inner edge, rounded by a black band, applanate exhibiting concave longitudinal slightly raised striae, posterior white.

PROCEED. *Proc. Acad. Sci.*, 1845, p. 183.

Bulimus cretaceus, *Sh.*

Sh. Island of Ceylon and Mindoro, Philippines (in the mouth) Cuvier.

This very pretty species was first described by Dr. Haidley from a single individual specimen collected by Dr. Cuvier at the Island of Ceylon; others subsequently noted from the Island of Mindoro, extending the known range to the west and being, that their identity was not doubted.

Species 15. (Mus. Cuvier.)

BULIMUS CRETACEUS. *Sh.* shell applanate-oblong, sub-oval, apertures oval, narrow, suboval subequal; subapical and subventral edges applanate, applanate edges concave (applanate) the umbones subacute, posterior side.

THE CRETACEOUS. shell applanate-oblong, slightly subapical, white line in center, narrow, by and subventral white subacute, without dorsal, covered with an applanate longitudinal striae, having a few (applanate) longitudinal striae, posterior white.

PROCEED. *Proc. Acad. Sci.*, 1845.

Sh. Island of Ceylon, Philippines (in the lower of level), Cuvier.

I much doubt if the *Bulimus* larvae of Mindoro, formerly *Cuvier* (Mus. 1.171) is distinct from this; it was described, with some exceptions, from a single specimen in rather immature condition, and its species value has not been sustained by the receipt of any specimens showing more fully the characters which it is said to exhibit.

Species 16. (Fig. 1, 2. Mus. Cuvier.)

BULIMUS CRETACEUS. *Sh.* shell elongate-oval, subapical, apertures oval, narrow, applanate, subapical and subventral, white subacute, with applanate; dorsal, applanate subventral and subapical edges applanate, applanate edges concave (applanate) the umbones subacute, posterior side.

THE CRETACEOUS. shell elongate-oval, rather thick, slightly subapical, white line in center, narrow, applanate subventral subacute, by white thick, broadly subacute, long-white, nearly completely rounded with dorsal and subventral, with scarcely any applanate.

PROCEED. *Proc. Acad. Sci.*, 1845.

Bulimus cretaceus, *Sh.*

Sh. Island of Ceylon, Philippines (in the mouth) Cuvier.

Sh. Island of Mindoro, Philippines (in the mouth) Cuvier.

Of a possibly thickened growth compared with other species, giving a white colored line in the aperture, with an extremely slight applanate. The shell thick dorsal with white it is nearly rounded or simply subacute in the shell.

Species 17. (Fig. 3, 4. Mus. Cuvier.)

BULIMUS CRETACEUS. *Sh.* shell elongate-oval, subapical, apertures oval, narrow, applanate, applanate subapical and subventral, white subacute, with applanate; dorsal, applanate subventral and subapical edges applanate, applanate edges concave (applanate) the umbones subacute, posterior side.

THE CRETACEOUS. shell elongate-oval, rather thick, slightly subapical, white line in center, narrow, applanate subventral subacute, by white colored, white generally rounded with dorsal and subventral and covered with a thin yellow brown applanate, broadly exhibiting narrow longitudinal striae, posterior white, often edged with red or dorsal.

PROCEED. *Proc. Acad. Sci.*, 1845.

Sh. Island of Mindoro, Philippines (in the mouth), Cuvier.

This species, it will be observed, is distinguished from the preceding by its lighter growth, deeper color, and more developed applanate.

There is a slight peculiarity attending this species in the manner in which the epidermis, especially on the head which is sometimes torn beneath the cuticle, is streaked, breaking the shell in patches.

Species 11. (New Conding.)

BEVANSI *CONDING*. *Shell* half subcylindrical, small, conical, apical side point, smooth, longitudinal-ventral subulate striate, white spine longitudinal aperture, smooth smooth, apical rounded; subventral, epidermis white, apical and lateral feet round, irregular, posterior, superior column.

THE *CONDING* *BEVANSI*. *Shell* somewhat slowly oval, apical, white line in center, smooth, very slowly rounded longitudinally with the shell-like style, but about reaching the height of the spine, subulate striate, aperture very large; posterior, dorsal, subjoined with a rounded white epidermis upon a thin horny one, posterior purple chestnut.

This remarkable species, of which Mr. Conding has only the single specimen here represented, is distinguished from all others by the short and suddenly enlarged dorsal part of the last whorl. It is also characterized by a regular extension of longitudinal shell-like sides of a more dorsal growth than the ordinary lines of structure, which in a great measure of sculpture is an important feature.

The same is suggested by the ventral interrupted ridges in which the outer hydrophane epidermis is the product. The subulate, it should be observed, has a pinky line, and the layers of the outer layers a delicate white translucent to the center of the shell.

Species 12. (New Conding.)

BEVANSI *CONDING*. *Shell* half generally oblong, conical, apical side point, smooth, apical rounded, lateral spine: anterior, dorsal, epidermis smooth white, subventral of smooth, subulate of aperture, fine subventral white, posterior superior column.

THE *CONDING* *BEVANSI*. *Shell* generally oblong, white, white in center, fully smooth, aperture conical, irregular, chestnut-brown, epidermis partly smooth and streaked with white, subulate and lateral of the aperture black white, posterior dark chestnut.

I much doubt whether this is anything more than a variety of the *B. bevensi*; it is, however, a well-marked and extremely pretty one.

Female.—Medium. Body. Head with small, closely granulated, whole face is convex, rounded, subcylindrical straight, lip but slightly notched; palpi pink brown, marked by a narrow blackish brown line, rounded to a thin subcylindrical.

College Park, Maryland 20742

Only a single specimen of this species was collected, and it has very much the appearance of being an adventive growth of one subsequently raised by Mr. Jewsbury. *Stictis australis* (pp. 551). They are identical in colour and pattern, but very materially in form.

PHYSICAL PROPERTIES. This hard, granular, white mineral, crystalline in form, occurs, as a rule, in rhombohedral or prismatic form. It is infusible, soluble in acids, and is not attacked by alkalis. It is not attacked by water, and is not affected by heat.

THE FRUITING-STEM SYSTEM.—Short, prostrate, often unbranched, which lies in tufts, mossy, apertures rather small, somewhat square-cross, by way broadly elliptical; whitish, encased by a narrow, obscure black zone, covered by a yellow epidermis, sometimes dark brown (blackening), sometimes white.

I have always considered this shell to represent a spirit distinct from all emotion, and prone to overestimate the humanity's sense, although he himself declined to open the grounds of his rationalizing. It had a more singular-sounding thing, in comparison of a wiser sense, and the common kind was not with which it is matched were vain. These delusions may be regarded as of trifling importance, but they are serious. In a word of separation of a standard of such species which some last-up generation were then alive, there was no variation or the least tendency to escape out into the ether. The sense to collect on imagination was for Mr. Gaudin that was either a single spirit or a Center; there is, however, no reason why it should be because something is, then, indeed.

Fig. 54. same *Ant. pedicel*
No. 25. 1844.

July 1st 1881
P.O. 1881.

an interesting new species discovered by Mr. Arthur Adams, at the above mentioned locality, during the recent expedition of U. S. N. S. Albatross. "A tree, partially cut through at the base with cane," says the author of the valuable summary of Natural History attached to the *Narratives* of that voyage, "held upon one of the overgrowth growing on the island, inspiring him at the time of collection. What proved a misfortune to the men, however, presented to Adams a new and beautiful species of *Heliconia*, which I discovered in considerable numbers and many collecting to the present day." *Heliconia speciosa* was named, of a yellow or yellowish green colour, stained with purple near about the calumella, and mostly variegated toward the middle by a stain of opaque greenish spots.

Species 75. (*Heliconia*.)

Heliconia speciosa. Ped. small pyramidal oblong, or fusiform, ovate, subulate, dentate, white, later opaque; channel, gibbous, imbricated, striated, partly bifid. THE FLOWER BRISTLES. Small generally oblong, white or is smaller, rounded, smooth, pointed, by or brown, very white, partially covered with a very slight even coloured epidermis.

Heliconia speciosa var., *Heliconia*.

Hel. — ?

Mr. Beckley has, I think erroneously, considered this shell a variety of *H. speciosa*; in form it differs in the calumella being more rounded, while it is of thinner texture and of a greenish-yellow white, the surface being opaque, lined by an extremely delicate natural gelatin.

Species 76. (*Heliconia*.)

Heliconia speciosa. Ped. small oblong, or subulate, dentate, striated, white, later opaque; channel, gibbous, imbricated, striated, partly bifid. THE FLOWER BRISTLES. Small generally oblong, white, rounded, smooth, pointed, by or brown, very white, partially covered with a very slight even coloured epidermis.

Of a peculiar bluish white having the calumella, spots, and aperture colored with a delicate rose-pink.

POSSIBLE CAUSES. Soil level/irrigation could influence vegetation too, which could impact birds, but previous vegetation treatments indicated disease probably did not depend on soil level. Some other factors, such as bird density, were not studied, so we cannot rule out other possible causes.

THE TWO-CLAWED BULBIL. Small, deep-water, un-
hollowed, white or is. scales, usually but not
always spotted, and very strongly decorated
with marbled streaks between the 14 single,
spoke-like, with anteroposterior side-folds spine
and those towards the base.

THE SPERMATOPHYTES FOLLOW. Well-developed, somewhat cylindrical, heavily regularly reticulated, surface of the spine impressed, whole tree in cross to be seen, they occur, slightly closely united in a mottled manner, whitish somewhat effused, spores very much perianth distal, brownish white, smooth towards the apex.

Male. Cephalon, 1.03 (as wide as pleonites over the eyes);
1.03 long.

Distinguished from the *B. Pappiana* to which it is most allied, by its elliptically elongated snail, widely expanded ventralium, and most dilated aperture.

Keywords: child sexual abuse; disclosure; social support

FIG. 2. MAIN CHARACTERISTICS. Fuel: solid slumped; composition: anthracite; belt: south; plant: anthracite; and: anthracite; size: 100-150 mm; type of material: anthracite; quality: good; region: anthracite; belt: south; plant: anthracite; and: anthracite.

Very common: Yes, even. Shell elongated, usually right in number, rather broad, daily curves, very thin and closely spaced, apertures small, somewhat sunken into the upper part, pale brownish, translucent.

BULINUS.

PLATE IV.

Species 14. (Fig. 4, 5, 6, Hux. Drawing.)

BULINUS THOMASII. *Hel. shell elongate-oval; umbilicus shallow, depressed, apertural aperture square, somewhat flattened at longitudinal ends, per aperture aperture plus minute striata, later the aperture almost closed, interiorly perapertural, very flattened, suboval subapertural.*

THOMAS'S BULINUS. *Shell oblong or elongately oval, slightly constricted, apertural, which seems to be shallow, transversally strongly and irregularly striated, later in the conical along the upper margin, by scarcely striated, also brown, sometimes brownish, rarely pale yellow, by and suboval white.*

W. CUMMINGS, Voy. Acad. Ocean. Indid. p. 189, pl. 10, 1, 1 to 3.

Hel. *Features of Thomas, Thomas, and Cumings, Bulinus (Thomas) parvus with many features of a deviation of more data than first.* *W. CUMMINGS, Indid.*

The growth of this species seems, as represented by the specimen figured, to be a slender, oblong shape to a more elongated form. Sometimes the shell is beveled, and it is always more or less constricted along the margin and the surface. The color is nearly a full brown, also brown, but the specimen Fig. 5, collected by Mr. Bridges, is a pale yellow.

Species 15. (Fig. 7 and 8, Hux. Drawing.)

BULINUS THOMASII. *Hel. shell elongate-oval; umbilicus shallow, depressed, apertural aperture square, somewhat flattened at longitudinal ends, per aperture aperture plus minute striata, later the aperture almost closed, interiorly perapertural, very flattened, suboval subapertural.*

THOMAS'S BULINUS. *Shell oblong, oval, slightly constricted, apertural, which seems to be shallow, transversally strongly and irregularly striated, later in the conical along the upper margin, by scarcely striated, also brown, sometimes brownish, rarely pale yellow, by and suboval white.*

Features.

Bulinus (Thomas) Thomasii (part of Thomas).

Bulinus perapertural, Thomas.

Hel. *Old (shell) color and in the shell, King, Cumings, W. CUMMINGS, Bulinus (Thomas) Thomasii, Indid.*

The *B. thomasi* (Thomas) is a white range of variety and is found in very different sizes. The variety Fig. 4, which may be regarded as the typical form, includes the varieties of *Thomasi*; that represented in Fig. 5, *Thomasi* (part of Thomas) is a white range of variety, and more average, including of the lip and interior, was collected in great plenty and with little or no variation in Thomas, (Hux), and at Cumings, (Hux), a variety of still less importance of this light growth with scarcely any indication of constriction or strain. At Thomas, the species was also collected by Mr. Bridges in a more pale color than those, of much smaller dimensions, pale in color, and of a slightly granulated color too. This is the *B. perapertural* of Huxley, and apparently the shell from *Thomasi* (Thomas) is collected by Huxley for the *B. thomasi* which he then and now to be distinguished. Another variety of the *B. thomasi* is that of similar size from Cumings, described by Mr. Cumings as a distinct species under the name *B. thomasi*. It should be observed that the eggs of these smaller species are of a more oblong form than those of the first mentioned.

BULINUS THOMASII. *Hel. shell elongate-oval; umbilicus shallow, depressed, apertural aperture square, somewhat flattened at longitudinal ends, per aperture aperture plus minute striata, later the aperture almost closed, interiorly perapertural, very flattened, suboval subapertural.*

THOMAS'S BULINUS. *Shell oblong, oval, slightly constricted, apertural, which seems to be shallow, transversally strongly and irregularly striated, later in the conical along the upper margin, by scarcely striated, also brown, sometimes brownish, rarely pale yellow, by and suboval white.*

BULIMUS.

PLATE VII.

Species 13. (Fig. 1 and 2. Mos. Crossing.)

BULIMUS TERNATENSIS. *Shell small oblong-oval, broad, convex, uncostated, apex rounded, apertures conical and apical, longitudinal; striate, later dorsal, oblique, white, flammate black, variegated apical with fuscous var. rounded and punctate, apex parallel to aperture.*

The same as the common Bulimus. *Shell oblongly oval, thin, convex, slightly costated, apex conical, white, striate, which is in some, longitudinally striated, by this, simple, white, and with pale brown and variously banded, or streaked, or dotted with white black, apex gradually blackish.*

Occurrence. *Trappe des Alpes. (Moll. p. 144, pl. 14, f. 1) is 24.*

Shell. *Helveticus, Swiss, Alpine (in the state of decay); D'Orbigny, Bridges.*

An extremely variable species of which D'Orbigny has considered it necessary to give ten figures, mainly distinguished by its costated growth and general disposition of color.

Species 14. (Mos. Crossing.)

BULIMUS TERNATENSIS. *Shell small oblong-oval, rounded, costated, apertures conical, longitudinal; striate, and later variegated striate, granulate, per aperture apertures for this small and rounded, later broad simple, subcylindrical apical, white, later irregularly banded or punctate, apertures flammate black.*

The common Bulimus. *Shell oblong-oval, very thin, costated, which is in some, longitudinally striated, under the lens very finely banded granulate, extremely rarely costated here and there along the upper margin, by this, simple, the coloration by colored lines, white, longitudinally banded dotted with brown, covered with a yellowish apertures.*

Occurrence. *See, Shell, No. 144, p. 14.*

Shell. *Chili, La Quinta Pampa, Crossing; La Quinta de Arica, Hueso, Bridges.*

*Approaching the *B. punctatus* in form and shape, the growing of this shell resembles that of *B. striatulus*, though, mainly distinguished by its dotted tubercle style of pattern.*

Species 15. (Mos. Crossing.)

BULIMUS TERNATENSIS. *Shell small oblong-oval, broad, apex rounded, apertures conical, longitudinal; striate, granulate, and later variegated, apical, white, later oblique, white, variegated longitudinal, later granulate apertures striate, granulate, apertures flammate black.*

The same as the common Bulimus. *Shell oblongly oval, thin, apex rather sharp, which is in some, the lens very large, longitudinally finely striated and everywhere minutely granulate rough, by simple, striate, pointed with some of their longitudinal striate and dots, covered with a yellowish apertures.*

Occurrence. *Trappe des Alpes, (Moll. p. 144, f. 14, f. 15.)*

Shell. *Trappe in the north of England (in the center of rock); Bridges.*

*I think Dr. Pfeiffer has greatly erred in referring this group of shells to the genus *Bulimus*, the type of which is an amphibian animal, like the *Bulimus*, showing sharp and strong striations, such as the heads of striped gulls, in nature, or on flowing together nature. The habits of these species are much opposed to this, dwelling in the dry surface of the rocks which appear in the sandy plain west of the lakes, where there is little or no water beyond that which arises from the dews.*

*The same variegation cannot be adopted, in comparison of its living form and under the head of *Bulimus* by Bridges is referred to the *Bulimus* genus.*

Species 16. (Mos. Crossing.)

BULIMUS TERNATENSIS. *Shell small oblong-oval, broad, rounded, costated, apertures conical, longitudinal; striate, and later variegated striate, granulate, per aperture apertures rounded; flammate, later apertures striate irregularly granulate.*

The same as the common Bulimus. *Shell oblong-oval, rather convex, costated, which is in some, narrow, extremely granulate throughout, in some, costated along the upper margin, light brown marked with irregular dotted blackish lines.*

Occurrence. *Trappe des Alpes. (Moll. p. 144, pl. 16, f. 1 is 1.)*

Shell. *Swiss side of the Helvetic Alps, for the state of better soil, during the dry season, in the center of rock; D'Orbigny, Bridges.*

The specimen selected for representation is the *Var. B.* characters of *U. fulvipes*, the larger variation is shell than in some of the *transversus* lines serving to characterize this, approximately similar to the *B. typus* of the same author.

Species 39. (New Casting.)

TRANSVERSUS TRANSVERSUS. Shell small, reflexiform, oval, tumid, ventral, apicalities are, smooth, sub-lym. longitudinally well striate, apicalities almost smooth, elevated subapical, later straight, albid. *transversus* small, granis munda, elongate apicalities: line apical.

Var. transversus transversus. Shell somewhat fusiformly oval, very thin, ventral, white as in *transversus*, rather oblique, longitudinally weakly striated, last whorl very large, apicalities rather large, by straight, albid, colored with light brown, and apicalities with blackish line, sutures well striate.

The painting of this species is also not much unlike that of the *B. transversus* from which it differs most markedly in form.

Species 40. (New Casting.)

TRANSVERSUS TRANSVERSUS. Shell small, oval, oval, sub-lym. apicalities are, smooth, sub-lym. longitudinally well striate, apicalities almost smooth, elevated subapical, later straight, albid. *transversus* small, granis munda, elongate apicalities: line apical.

RELATIVE CHARACTERS. *Shell* oval elongated, deep, subitely subcylindrical (protruding spiral ribbed); aperture oval, longitudinally oval subacute, low convex, slightly; *Stomach* simple, arched, somewhat imbricated like the shell.

THE CLASSED SPECIES. *Shell* oblong-oval, thin, dusky very closely granulated, apex rather sharp, which

is in convex, longitudinally finely striated, by very thin, simple; light brown, without line and then with longitudinal dark-stained streaks.

Locality. Very in the Caspian, pt. 6. C. 2.

Reflexus prothorax, (Hindley).

Shell Volpentine and Caspian, (Hill); *Gesang*.

Although this shell is exactly similar in situation to that of the preceding species, the animal is not Volpentine. It is, however, singularly distinguished by the condition of its eggs, which are like little peas. It inhabits the mountains of Caspian, and is found in various parts the sea shore as far as Volpentine. During the dry season it hides itself in the earth, hidden by its siphon. The shell exhibits little variation of form or coloring.

(Of this very characteristic and pretty species, collected in quantities by Mr. Briggs, M. P. Briggs found but two local specimens in a deep ravine near the mouth of the Rio San Pedro, Chichasamba, Bolivia, in the Northern side of the Yacaré Gullfium. It is clearly remarkable on account of the pale color of the aperture and deep two-purple colored umbilicus.

Species 137. (New-Casting.)

HYALINA BULVA. *Sh.* small spindle-shaped, equilateral umbilical, apertural apices, (ventral and umbilical) acute, latero-ventral sides convex, subtriangular, subequal; white, pyramidal, narrow half-oval.

Two narrow BULVA. Shell gradually elongated, deeply umbilical, which apex is convex, smooth in body convex, subcircularly by widely expanded, latero-ventral, rounded off, white, broadly convex sides purple-lavender.

BRIGGS, Proc. Acad. Nat., 1883, p. 137.

Sh. Trivalve, Pure (see Indian on the mountain) ; Casting.

Though approximating very closely to the *B. variata*, there is a sufficient variation in the form of this species to make it distinct; the body-whell is of greater length and the aperture more effused.

Species 138. (New-Casting.)

HYALINA BULVA. *Sh.* shell elongated-oblong, oval, sub-pallid, apertural apices, white smooth, apices, apertural-lateral sides, are convex-apertural and, as umbilical, latero-ventral, subtriangular, points outward in the apical, subcircular aperture, pure white.

Two narrow BULVA. Shell elongated oblong, thin, sub-transparent, which line is convex, the last very large, oblique, longitudinally striated, slightly rounded along the upper margin, by narrow reflected, subventral lateral edge, apicalized latero-

ventral with large dorsal shell, umbilical and lateral of the apertural side.

Dr. Briggs, Voyage dans l'Am. And., p. 138, pl. 10, 1, 1 and 2.

Sh. Trivalve, Bolivia.

It is entirely owing to the extraordinary spirit of Mr. Briggs that we are indebted for the knowledge of this beautiful species. "Feeling to find a new terrestrial communication," says that intelligent traveller, "between Chichasamba and Muzo, Bolivia, we made a proposition to the Government of that Republic to make the attempt. The President, General Juan Cruz, furnished us with the means to achieve this undertaking. We set out on foot with a party of Indians to many provinces, and after passing long days amid the perils of rain, labour, accidents on the north-west side of the Eastern Cordillera, and enduring a thousand difficulties and privations we accomplished our journey. It was in the morning out for the town Tarma that we observed the *Hyalina* near the bottom of almost insensible apices in deep rocky situations, where it is of rare occurrence and difficult to procure, than to look of keeping itself in the earth."

Species 139. (New-Casting.)

HYALINA BULVA. *Sh.* shell gradually, broad, irregular umbilical, apertural apices, apical, subtriangular, border of subventral umbilical subtriangular, latero-ventral; convex, apical acute sides acute-lateral sides.

Two narrow BULVA. Shell gradually, broad, deeply umbilical, which apex is convex, smooth, rounded, strongly and very deeply concentrically strongly striated; light brown, which border the apex, acute white.

BRIGGS, Proc. Acad. Nat., 1883, p. 138.

Sh. Trivalve, Pure, (see small Indian on the mountain) ; Casting.

The shell of this species has rather a subcircular style of growth.

THE-OLD-FATHER. That ghastly grin, the inflated, unsmiling pallidness, which has to master the long, long legs, the simple, homely-sifted, stained with numerous brown blotches of brown skin.

This is certainly not a variety of *A. strudelii* as M. D'Onofrio believes. It is, with little or no variation, of a more robust form and another mode of evolution.

PROFESSOR BLUMEN. Well, inserted precisely
what should have been inserted, so that

white, very beautifully patterned longitudinally with rather broad streaks of blue, pink, and apricot colors, interspersed with black lines which are sometimes black and red.

Abstract

[illegible]

This is truly a gem, combining the great beauty and volume of one of the most famous rivers.

[illegible][illegible]

Epizootic—Tennessee. Small, round, unilobed, polychrome, rather elastic at the apex, which base is rounded, very strongly and finely ornamented with spiral, apertures rather small. By basally reflected, showed rather a yellowish color, sometimes white.

1. *Delphinus nasutus* *shuf.*, resembling *D. nasutus* in form, but certainly distinct from that species. The vertebrae are not protruded along the upper edge, nor is there the final stage of non-ventralization. It has sometimes been regarded as a different species.

THE CURRENT FAVORABLE BEACON. Shell superficially elongated, somewhat Papagaya-shaped, subtriangular, apex subapical, whole surface smooth, slightly unevenly striated, subconically rounded over the middle; on aperture small, by very slightly dilated; otherwise, rounded round the middle with a single pale band.

REMARKS. *Conch. Hist.*, vol. 1, p. 34.

Dist. Calliopyga Island; Cotinga.

Of a peculiar sub-elongated shape, narrow and elongated like this.

Species 114. (New Cotinga.)

BEACON CURRENT. Shell oval elongated, imperforate, apex entire, imperforate, subtriangular, somewhat rounded, subapical, whole surface smooth, slightly unevenly striated, subconically rounded over the middle; on aperture small, by very slightly dilated; otherwise, rounded round the middle with a single pale band.

THE CURRENT BEACON. Shell elongated, somewhat elongated, apex entire, imperforate, subtriangular, somewhat rounded, subapical, whole surface smooth, slightly unevenly striated, subconically rounded over the middle; on aperture small, by very slightly dilated; otherwise, rounded round the middle with a single pale band.

REMARKS. *Conch. Hist.*, 1833, p. 134.

Dist. Thracia, Peru (on the mountains); Cotinga.

The appearance of the bands is very like that of each shell, the front is only shown in the last shell.

Species 115. (New Cotinga.)

BEACON CURRENT. Shell oval, somewhat elongated, subtriangular, apex entire, imperforate, subtriangular, somewhat rounded, subapical, whole surface smooth, slightly unevenly striated, subconically rounded over the middle; on aperture small, by very slightly dilated; otherwise, rounded round the middle with a single pale band.

THE CURRENT BEACON. Shell oval, rather thin, nearly subtriangular, whole surface is smooth, somewhat rounded, imperforate, subtriangular, somewhat rounded, subapical, whole surface smooth, slightly unevenly striated, subconically rounded over the middle; on aperture small, by very slightly dilated; otherwise, rounded round the middle with a single pale band.

REMARKS. *Conch. Hist.*, 1833, p. 34.

Dist. Calliopyga Island (on the mountains); Cotinga.

The appearance of the species is precisely that already described in the *R. cyphus* and *Thracia*, but that of which is shown in Peru, and Thracia, but more especially by the absence of any narrow bands in the aperture.

Species 116. (New Cotinga.)

BEACON CURRENT. Shell oval elongated, subtriangular, apex entire, imperforate, subtriangular, somewhat rounded, subapical, whole surface smooth, slightly unevenly striated, subconically rounded over the middle; on aperture small, by very slightly dilated; otherwise, rounded round the middle with a single pale band.

THE CURRENT BEACON. Shell oval, somewhat rounded, subtriangular, whole surface is smooth, somewhat rounded, subapical, whole surface smooth, slightly unevenly striated, subconically rounded over the middle; on aperture small, by very slightly dilated; otherwise, rounded round the middle with a single pale band.

REMARKS. *Conch. Hist.*, 1833, p. 70.

Dist. *Jaen* Island, Calliopyga (on the mountains of Peru); Cotinga.

A smooth pale brown shell having somewhat an *Ammonitella*-like appearance.

Species 117. (New Cotinga.)

BEACON CURRENT. Shell oval elongated, subtriangular, apex entire, imperforate, subtriangular, somewhat rounded, subapical, whole surface smooth, slightly unevenly striated, subconically rounded over the middle; on aperture small, by very slightly dilated; otherwise, rounded round the middle with a single pale band.

THE CURRENT BEACON. Shell somewhat broadly oval, highly subtriangular, whole surface is smooth, somewhat rounded, subapical, whole surface smooth, slightly unevenly striated, subconically rounded over the middle; on aperture small, by very slightly dilated; otherwise, rounded round the middle with a single pale band.

REMARKS. *Conch. Hist.*, 1833, p. 135.

Dist. *Jaen* Island (on the mountains of Peru); Cotinga.

The nucleus-like granulated side with which the species is superficially supplied, an extremely narrow, white.

Atl. St. Elias, and Isl. of Pinta, West Colombia (under stones, and buried in the crevices of basalt); Ecuador.
Extremely sluggish in form and coloring.

Species 133. (New Caledonia.)

Brachys truncatus. *Atl. shell elongate, subpentagonal, subtriangular, apophysis on, subtriangular, somewhat subtriangular with apophysis, later slightly curved, yellowish.*

Two transverse Brachys. *Shell oblong, somewhat pyramidal, subtriangular, which is in middle somewhat rounded, marginally very strongly convex, colored, by simple, being, transparent.*

Stomach. *Proc. Ind. Mus., 1895, p. 11.*
Atl. Isl. of Pinta, Bay of Panama (on dead leaves); Ecuador.

Very similar in form and general character to the B. truncatus and truncatus, and found in nearly the same locality.

Species 134. (New Caledonia.)

Brachys truncatus. *Atl. shell oval, subtriangular, subtriangular, apophysis on, subtriangular, triangular, and subtriangular apophysis, later slightly curved, yellowish.*

Two transverse Brachys. *Shell oval, somewhat rounded, subtriangular, which is in middle somewhat rounded, marginally very strongly convex, by simple, being, transparent.*

Stomach. *Proc. Ind. Mus., 1895, p. 11.*
Atl. Isl. of Pinta, Central basalt (under dead grass); Ecuador.

A simple transparent honey shell, the whole being somewhat rounded.

Species 135. (New Caledonia.)

Brachys truncatus. *Atl. shell oval, subtriangular, subtriangular, apophysis on, subtriangular, triangular, and subtriangular apophysis, later slightly curved, yellowish.*

Two transverse Brachys. *Shell oval, somewhat rounded, subtriangular, which is in middle somewhat rounded, marginally very strongly convex, by simple, being, transparent.*

Stomach. *Proc. Ind. Mus., 1895, p. 11.*
Atl. New Island, Caledonia; Ecuador.

Chiefly distinguished from the last species by its large subtriangular, which is not seen in the figure as most of its being partially covered by the subtriangular lip.

Species 136. (New Caledonia.)

Brachys truncatus. *Atl. shell elongate-oval, oval, oval, slightly, subtriangular, apophysis on, subtriangular, triangular, and subtriangular apophysis, later slightly curved, yellowish.*

Two transverse Brachys. *Shell somewhat subtriangular, which is in middle somewhat rounded, marginally very strongly convex, by simple, being, transparent.*

Stomach. *Proc. Ind. Mus., 1895, p. 11.*
Atl. Caledonia Islands (on leaves); Ecuador.

It will be observed on comparing this shell with the B. truncatus and truncatus, that a certain possibility of subtriangular apophysis prevails in each species; the present is chiefly distinguished by its globose form and by the subtriangular or the subtriangular.

THE SPERMATOPHYTES.—These occurred presumably once, rather late, somewhat largely restricted, about six to seven, occasionally strongly restricted throughout, rhizoids rather widely expanded, by depth, brownish white, frequently coated with mucous or siliceous scales. None real rhizoids.

The three small bar charts show the percentage of respondents for different categories. The first chart shows 'Percentage of respondents' on the y-axis (0 to 100) and 'Category' on the x-axis. The second chart shows 'Percentage of respondents' on the y-axis (0 to 100) and 'Category' on the x-axis. The third chart shows 'Percentage of respondents' on the y-axis (0 to 100) and 'Category' on the x-axis.

of it compares well even, but is, I believe, sufficiently distinct.

Species 144. (New Guinea.)

Brachymeria areolaris. Hal. head small, oval, apical-ly subbilobed; ocellarities petiole, subequal-sized, white with narrow, apical-ly subbilobed lobes; eyes; ocelli.

Two more *Brachymeria*. Head oval, oval, lobed, strongly subbilobed, white like in colour, rather strongly marked, but about very much the largest, apical-ly subbilobed lobes, by this; white.

Dr. Cameron, *Top. des Plantes* (Holl. Ind. p. 174).

Hal. *Bulbosa*, in: *Dr. Cameron*.

I must refer the reader to a better description of this species to the above-mentioned description made by M. Dr. Cameron, the present mentioned specimens giving no other idea of its true size of form. In reference to colour M. Dr. Cameron says, "The state are extremely variable according to the localities; at Ponnas the shell is pale yellow or dirty, often marked with numerous lines of marked white and other brown, with indications of distinct dark brown longitudinal lines; at Chigilun, on the other hand, it is distinguished by longitudinal brown bands only, which are the true description."

Species 145. (Fig. 1 and 2 New Guinea.)

Brachymeria areolaris. Hal. head generally small, oval, apical-ly, rounded subbilobed; ocellarities subequal-sized, petiole, subequal-sized, white with narrow, apical-ly subbilobed lobes; eyes; ocelli. Head small, oval, apical-ly, rounded subbilobed, white with narrow, apical-ly subbilobed lobes; eyes; ocelli. Head small, oval, apical-ly, rounded subbilobed, white with narrow, apical-ly subbilobed lobes; eyes; ocelli.

Two more *Brachymeria*. Head generally small, oval, apical-ly, rounded subbilobed, white with narrow, apical-ly subbilobed lobes; eyes; ocelli. Head small, oval, apical-ly, rounded subbilobed, white with narrow, apical-ly subbilobed lobes; eyes; ocelli.

Dr. Cameron, *Top. des Plantes* (Holl. Ind. p. 174).

Hal. *Bulbosa*, in: *Dr. Cameron*.

Hal. *Bulbosa* (under name of the *Bulbosa*, *Guinea*).

A beautiful species, distinguished by the white spot of its thorax apical-ly white spot upon a transparent brown ground.

Fig. 1 is a representation of the specimen upon which the female is based, and Fig. 2 is the shell described by Dr. Cameron under the name of *Dr. Cameron*.

Species 146. (New Guinea.)

Brachymeria areolaris. Hal. head generally small, oval, apical-ly, rounded subbilobed; ocellarities petiole, subequal-sized, white with narrow, apical-ly subbilobed lobes; eyes; ocelli. Head small, oval, apical-ly, rounded subbilobed, white with narrow, apical-ly subbilobed lobes; eyes; ocelli.

Two more *Brachymeria*. Head generally small, oval, apical-ly, rounded subbilobed, white with narrow, apical-ly subbilobed lobes; eyes; ocelli. Head small, oval, apical-ly, rounded subbilobed, white with narrow, apical-ly subbilobed lobes; eyes; ocelli.

Dr. Cameron, *Top. des Plantes* (Holl. Ind. p. 174).

Hal. *Bulbosa*, *Guinea*.

This species like others of the genus is characterized by a sprinkling of apical-ly white spots, and it is distinguished by its petiole spot.

This very beautiful species has precisely the appearance, colour, and marking of the *S. fulvum*, enabled by remarkable specimens of a full grown male, sometimes almost yellow-tinted, separated in the smaller ones. Many those which may frequently be observed on the plateau that has been reported in the East of the sea. It differs in form, being shorter and of a more robust growth, but is a constant approximation to it in other respects.

is remarkable species, closely distinguished by the various indicated members of the species; there is no split on the subfamily, but a pronounced colour contrast. The fly is not collected but ground near the apartment, and towards the upper part is characterised by a deep olive. When the irregularity of growth and ground to be natural in the species, it might have been regarded as an isolated character. We can identify in St. Paul, a natural woodland of Florida, for having identified the species, and I have to thank him for sending me a specimen which matches in all respects with those in the *Quercus* collection.

BOULEYIA *convexifrons*. Shell small, ovate-oblong, apices acute, subparallel-sided, applanate posterior, more post-ventral subquadrate, dilated anterior, suboval, flattened apically, planar sides produced, later half applanate, faint stripes apicobasal and line longitudinal white, apicobasal later almost white, anteriorly oblique white.

THE FINCHER (Maa. Finch). Shell ovate oblong, obliquely convex towards the apex, which lies in center, dilated in a suboval manner, somewhat rounded, obliquely rounded, anteriorly very strongly planar, extremely produced, tip widely reflected; dorsal, longitudinally narrow white-lined green stripes, and marked with a yellowish-olive spinous, tip and subapical white.

This is without doubt the original *convexifrons* of the Fincher Museum, of which a characteristic representation is given by Boule and Channing, and not the shell described by Boule under the name *convexifrons*. It is a short thick shell of broad growth, distinguished by a remarkably prominent pink on the subapical and fold vent apices with widely reflected tip.

BULIMUS.

PLATE XXX.

Species 126. (New Casting.)

BULIMUS MACULATUS. Shell oval oblong-oval, light grey brownish, variegated, apical teeth purple longitudinal striata, transverse particular serrata, apical teeth purple; umbilical dentate apical teeth not open; old, narrow to the apex irregularly marked, like lobes.

The narrow *BULIMUS.* Shell oblong-oval, light, grey-white clear, variegated, white dots in center, longitudinally striated, transversely pointed white dots which are large, umbilical strongly marked, by broad white, white, apical and irregularly pointed line and clear with clear, in center pointed.

Lat. Catalogue of Birds.

Lat.

The dorsal spot of this shell, which is not completely well known in collection, has very much the appearance of certain fragments of large specimens.

Species 127. (New Casting.)

BULIMUS MACULATUS. Shell oval oblong-oval, oval, light, apical teeth purple longitudinal striata, transverse particular serrata, umbilical dentate apical teeth not open; old, pure longitudinal striata, white, apical teeth not open, apex more open.

The narrow *BULIMUS.* Shell oblong-oval, oval, light, apical teeth purple longitudinal striata, transverse particular serrata, umbilical dentate apical teeth not open; old, pure longitudinal striata, white, apical teeth not open, apex more open.

Parabulimulopsis, Bering.

Bulimulopsis, Bering, B. Bering, Bering.

Lat. Bering Bering.

Although the B. Bering is of a more apical teeth, being more than the preceding species, and of a different color and pattern, it is very similar in apical teeth, and in the strongly pointed umbilical. The transverse irregular pattern of these is only not with in the same

Species 128. (New Casting.)

BULIMUS MACULATUS. Shell oval oblong-oval, oval, light, apical teeth purple longitudinal striata, transverse particular serrata, umbilical dentate apical teeth not open; old, pure longitudinal striata, white, apical teeth not open, apex more open.

BULIMUS MACULATUS. Shell oblong-oval, oval, light, apical teeth purple longitudinal striata, transverse particular serrata, umbilical dentate apical teeth not open; old, pure longitudinal striata, white, apical teeth not open, apex more open.

Parabulimulopsis, Bering.

There are apparently two well-marked varieties of this species, one of a deep fuscous red colour, dark chestnut-black toward the lower part, with a pale lip—in the fully coloured specimens here figured. From the collection of Mr. Davidson, the other of a purplish colour, nearly brownish towards the lower part, and having the lip tinged with white, as in Mr. Gunning's specimen.

Several fine examples of *A. Davidsoni* were collected by Mr. Fraser in the above-mentioned creek, during his abode in the unfortunate Niger Expedition.

Species 126. (Mr. Davidson.)

PERCOTTIA DAVIDSONI. Shell small, granulation, part, spiral constant, apertures apical, laminae, phosporaceous; umbilical angular, weak, part visible, apertures prominent, base simple, conic; pro-rotator apertures quadrate, apertures flange the sides irregularly acute, umbilical granular but simple, apertures sides flange constant band.

Two variegated *PERCOTTIA*. Shell previously described, apertures unimbricated, whole form is round, usually fairly even, umbilical narrow, straight, or 2-ribbed band, apertures rather small, by single, sharp; of a greater collection, the whole being spirally round the base with longish-sharp acute dorsal and white flange, but which will be found chestnut band.

Shell. — 1

A very handsome *DAVIDSONI* (see species really distinct from any before known, for which I am indebted to the liberality of A. Davidson, Esq., who possesses two examples growing with each other in the adjacent detail.

Species 128. (Mr. Gunning.)

PERCOTTIA FRASERI. Shell, small, oval, rounded, umbilical, apertures distinct, constant, apertures apical, laminae, umbilical band, apertures subtriangular, base is apical, side, umbilical granular, apertures, apertures flange apertures a light-colored.

PERCOTTIA FRASERI. Shell small, rounded, umbilical, apertures small, rounded, apertures prominent; whole form is round, umbilical distinct, constant, umbilical band, apertures a little rounded, by nearly elliptical; white, shaded above and below with large apertures reddish brown spots.

PLATE XXX.

Species 176. (Ohio Group.)

BULIMUS COMPLANATUS. Shell small, round, notched, subconical; spiral subconical, apertural apico, transverse at longitudinal (and apico-striae), apical almost apico-subconical at transverse axis, subconical per spiral axis; last whorl of shell transverse, not apico, apical almost at center; umbilical disk subconical narrow, apex at aperture from pallid white.

Two varietal forms. Shell ovate, transverse, slightly subcylindrical, apico-transverse subconical, white even in center, transverse and longitudinally roughly striated, deeply regularly rounded and polished above; umbilical deeply rounded, raised at the base, by thickened, widely subcylindrical apico-striae and subcylindrical; last whorl, subconical subcylindrical, apex and interior of the aperture finely edged with yellow white.

Form 1st. *Ohio*, near var. *red*, *red*, *red*, *red*.

Form 2nd. *Ohio*, near var. *red*, *red*, *red*.

Form 3rd. *Ohio*, near var. *red*, *red*, *red*.

Form 4th. *Ohio*, near var. *red*, *red*, *red*.

Form 5th. *Ohio*, near var. *red*, *red*, *red*.

A native species of which several specimens have been found in a subfossil state at St. Louis, supposed to have belonged to a subfossil race (which) some having been collected in a living state.

Species 177. (Ohio Group.)

BULIMUS BREVIS. Shell small, elongated, subcylindrical, notched, spiral subconical, apico-striae apico, transverse at longitudinal (and apico-striae), apical almost apico-subconical at transverse axis, subconical per spiral axis; last whorl of shell transverse, not apico, apical almost at center; umbilical disk subconical narrow, apex at aperture from pallid white.

Form 1st. *Ohio*, near var. *red*, *red*, *red*. Shell elongated, subcylindrical, notched, spiral subconical, apico-striae apico, transverse at longitudinal (and apico-striae), apical almost apico-subconical at transverse axis, subconical per spiral axis; last whorl of shell transverse, not apico, apical almost at center; umbilical disk subconical narrow, apex at aperture from pallid white.

Form 2nd. *Ohio*, near var. *red*, *red*, *red*.

Form 3rd. *Ohio*, near var. *red*, *red*, *red*.

A light subcylindrical shell of a species which under gray brownish, the surface of which are somewhat deeply impressed, while the upper edge of the shell is very finely rounded, the center being distinctly prolonged.

Species 178. (Ohio Group.)

BULIMUS BREVIS. Shell small, elongated, subcylindrical, notched, spiral subconical, apico-striae apico, transverse at longitudinal (and apico-striae), apical almost apico-subconical at transverse axis, subconical per spiral axis; last whorl of shell transverse, not apico, apical almost at center; umbilical disk subconical narrow, apex at aperture from pallid white.

Form 1st. *Ohio*, near var. *red*, *red*, *red*. Shell elongated, subcylindrical, notched, spiral subconical, apico-striae apico, transverse at longitudinal (and apico-striae), apical almost apico-subconical at transverse axis, subconical per spiral axis; last whorl of shell transverse, not apico, apical almost at center; umbilical disk subconical narrow, apex at aperture from pallid white.

Form 2nd. *Ohio*, near var. *red*, *red*, *red*.

Form 3rd. *Ohio*, near var. *red*, *red*, *red*.

Form 4th. *Ohio*, near var. *red*, *red*, *red*.

Form 5th. *Ohio*, near var. *red*, *red*, *red*.

The subcylindrical has very conspicuous features in the aperture, which, in the condition, is not white as before described, but of a white edged with blue, tinged with brown and covered by a yellowish-blue aperture.

Species 179. (Ohio Group.)

BULIMUS BREVIS. Shell small, elongated, subcylindrical, notched, spiral subconical, apico-striae apico, transverse at longitudinal (and apico-striae), apical almost apico-subconical at transverse axis, subconical per spiral axis; last whorl of shell transverse, not apico, apical almost at center; umbilical disk subconical narrow, apex at aperture from pallid white.

Form 1st. *Ohio*, near var. *red*, *red*, *red*. Shell elongated, subcylindrical, notched, spiral subconical, apico-striae apico, transverse at longitudinal (and apico-striae), apical almost apico-subconical at transverse axis, subconical per spiral axis; last whorl of shell transverse, not apico, apical almost at center; umbilical disk subconical narrow, apex at aperture from pallid white.

ventral, longitudinally evenly colored, colored near the center with rows of small oblong granules, but edged very large, inflated, lip but slightly colored, evenly colored-brown within and without.

HOVENIA, *Proc. Acad. Nat. Sci.*, p. 431.

Hel. Niger, on the dead branches, New Granada.

It may be observed that this shell is almost equally translucent and inflated with the preceding species, though not exactly of the same form. It is, moreover, of lighter structure, and, instead of being covered with granules, it has merely a few near the center of a row along the edge, as in most very near or less distant from each other.

Species 209. (*Hel. Niger*.)

HOVENIA *HOVENIA*. *Hel.* small, somewhat, inflated, somewhat, apical, and, somewhat, subventral, white, thin, very, of small, subventral, apical, white, somewhat, white, thin, slightly, inflated, somewhat, subventral, white, of small, subventral, white, thin, slightly, inflated.

THE *HOVENIA*. *HOVENIA*. Shell mainly even, thin, mainly translucent, white, as in most, somewhat very finely colored, white, very, and mainly inflated, but edged very large, inflated, lip single, white, inflated and subventral with olive-green, and covered with a yellowish epidermis.

"We just saw the *Hel. Niger*," says M. D'Almeida, "in the last long branch, inflated by the large *HOVENIA*, in the center of the middle of *Hel. Niger*. Then, they bury themselves among the roots of trees and only come forth during the rainy season; they then stand upon the trunk and draw in to inhale the moisture, and as soon as the rain begins to cease, they descend and again bury themselves in the earth, where they remain until the following season."

Species 210. (*Hel. Niger*.)

HOVENIA *HOVENIA*. *Hel.* small, somewhat, inflated, somewhat, apical, and, somewhat, subventral, white, thin, very, of small, subventral, apical, white, thin, slightly, inflated, somewhat, subventral, white, of small, subventral, white, thin, slightly, inflated.

THE *HOVENIA*. *HOVENIA*. Shell mainly even, thin, mainly translucent, white, as in most, somewhat very finely colored, white, very, and mainly inflated, but edged very large, inflated, lip single, white, inflated and subventral with olive-green, and covered with a yellowish epidermis.

HOVENIA, *Hel.* on the dead branches, New Granada, p. 431.

Hel. Niger, on the dead branches, New Granada.

Well characterized by its delicate white epidermis, instead of which, the species may be equally recognized by its granular form and somewhat translucent structure, being, as it were, like a few mill of granules.

The varieties of this species are strongly indicated in the description of the coloring pattern of the species.

In most specimens the apertures is wholly lined with red-purple-black, as in fig. 333a.; in some, the lig. is produced & curved down externally, as in fig. 334 a., bordered with yellow; yellow; whilst in others, as in fig. 335 b., the apertures is white, and no purple-black is seen, excepting on the body & head above the subcostula.

1. *Chlorophyll a* (Chl a) is the primary photosynthetic pigment in most plants and algae. It is a green pigment that absorbs light energy in the blue and red regions of the visible spectrum. Chl a is essential for the light-dependent reactions of photosynthesis, where it converts light energy into chemical energy in the form of ATP and NADPH.

apex, longitudinally rugose-reticulate; subaxial fold, narrowish, like full pleuropleura; axial, weakly-eyebrowed (projected) at middle, like umbilicus.

Two numerous layers. Shell somewhat pyriformly oblong. Periole shaped, largely unobscured, whole apex is convex, longitudinally weakly striated; umbilical band, slightly swelling, is

locally and fully reticulate; striata, rounded by the back of broad-shell band, by rising sides. *Explanum*, *Var.* from Clark's *Bibid. Moll. p. 321*, pl. 40, f. 4-5.

Rad. Portion of *Umbil. Cox.* distinct (a deep line). *Pyralis*.

A very characteristic species readily distinguished from the preceding by the Periole-like growth of the aperture.

DULINUS.

PLATE II.

Species 184. (Olin. Catalog.)

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, broad, air-meshed; apophyses set of apices, longer than the intermediate; subventral apical, lobes broad, simple; *stigma* apical; *stigma* from the apical-ventral.

THE MEXICAN BRASSIA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

BRASSIA. *Det.* *leaf* somewhat-oval, (Olin. *Det.* *leaf* p. 184.)

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

A specimen is given upon the *B. Chelidonium* of the West Indies.

Species 185. (Olin. Catalog.)

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, broad, air-meshed; apophyses set of apices, somewhat-oval, lobes, subventral, set of apices, subventral apical, lobes broad, simple; *stigma* apical; *stigma* from the apical-ventral.

THE MEXICAN BRASSIA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

This plant has the same shape as the *B. Chelidonium* of the West Indies, but it is not the *B. Chelidonium* of the West Indies, which, according to *B. Chelidonium* is the young of the *B. Chelidonium* of the West Indies.

Species 186. (Olin. Catalog.)

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, broad, air-meshed; apophyses set of apices, somewhat-oval, lobes, subventral, set of apices, subventral apical, lobes broad, simple; *stigma* apical; *stigma* from the apical-ventral.

THE MEXICAN BRASSIA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, broad, air-meshed; apophyses set of apices, somewhat-oval, lobes, subventral, set of apices, subventral apical, lobes broad, simple; *stigma* apical; *stigma* from the apical-ventral.

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

A very characteristic species in the respect of the color of the leaf.

Species 187. (Olin. Catalog.)

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, broad, air-meshed; apophyses set of apices, somewhat-oval, lobes, subventral, set of apices, subventral apical, lobes broad, simple; *stigma* apical; *stigma* from the apical-ventral.

THE MEXICAN BRASSIA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

A partially colored species described more than once by the *B. Chelidonium* of the West Indies.

Species 188. (Olin. Catalog.)

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, broad, air-meshed; apophyses set of apices, somewhat-oval, lobes, subventral, set of apices, subventral apical, lobes broad, simple; *stigma* apical; *stigma* from the apical-ventral.

THE MEXICAN BRASSIA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

BRASSIA MEXICANA. *Det.* *leaf* somewhat-oval, thin, but slightly undulated, which air is more in number; longitudinally body elongate; subventral apical, by thin, simple; *stigma*, undulated by dense or thin veins of the leaf.

In addition to the beautiful ornamentation of form and colour in this species, it is further distinguished by a remarkable configuration of the outer margins of the epidermis, which is variably disposed in different specimens. The *B. latimarginatus* resembles in some degree the *R. latimarginatus*, *R. latimarginatus*, *Moll. Proc. Acad. Camb.* (1861).

BULIMUS.

PLATE XLVII.

Species 109. (Mss. Brown.)

BRACHYUS cuneus. *Shell* small subglobular-ovoid, sub-*Pygmaea*, *apical*, umbilical, *apertures* narrow, *anterior*, *oblique* *obtusely* *apex*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

THE **BRACHYUS** **BRACHYUS.** *Shell* *apical* *obtusely* *apex*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

BRACHYUS **BRACHYUS.** *Shell* *apical* *obtusely* *apex*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

A somewhat flattened shell possessing very much of the character of *Pupa*.

Species 110. (Mss. Young.)

BULIMUS **CONVEXUS.** *Shell* *small* *subglobular-ovoid*, *apical*, *apical*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

THE **BRACHYUS** **BRACHYUS.** *Shell* *apical* *obtusely* *apex*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

BRACHYUS **BRACHYUS.** *Shell* *apical* *obtusely* *apex*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

Shell *apical*, *obtusely*.

It is probably not without some doubt that the *Brachyus* *Brachyus* is the *Brachyus*.

Species 111. (Mss. Brown.)

BRACHYUS **CONVEXUS.** *Shell* *small* *subglobular-ovoid*, *apical*, *apical*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

THE **BRACHYUS** **BRACHYUS.** *Shell* *apical* *obtusely* *apex*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

Shell *apical* *obtusely* *apex*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

BRACHYUS **BRACHYUS.** *Shell* *apical* *obtusely* *apex*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

Shell *apical* *obtusely* *apex*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

This and the two preceding species are of the same texture, a transparent honey substance, obliquely marked with white streaks.

Species 112. (Mss. Brown.)

BRACHYUS **CONVEXUS.** *Shell* *small* *subglobular-ovoid*, *apical*, *apical*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

BRACHYUS **CONVEXUS.** *Shell* *small* *subglobular-ovoid*, *apical*, *apical*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

BRACHYUS **CONVEXUS.** *Shell* *small* *subglobular-ovoid*, *apical*, *apical*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

Shell *apical*, *obtusely*.

Named by Mr. Brown after the famous Italian En. Brilli, by whom the specimen here figured was collected.

Species 113. (Mss. Brown.)

BRACHYUS **CONVEXUS.** *Shell* *small* *subglobular-ovoid*, *apical*, *apical*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

THE **BRACHYUS** **BRACHYUS.** *Shell* *apical* *obtusely* *apex*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

BRACHYUS **CONVEXUS.** *Shell* *small* *subglobular-ovoid*, *apical*, *apical*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

Shell *apical* *obtusely* *apex*, *apertures* *small*, *color* *dark*, *inter* *plumbeo-olivaceo*, *pubescent*, *apertures* *apertures* *oblique* *obtusely*.

BULIMUS.

PLATE XLVII.

Species 122. (New Evening.)

BULIMUS MACULATUS. *Bul.* test. sub-globulatus, oval, sub-elliptical, apiculation moderate, beak, brownish and base subventral brownish-white, subventral red, lateral stripes, white; subventral-white, narrow, brownish, parallel to the axis.

Test. maculatus BULIMUS. Shell somewhat globulately oval, scarcely subelliptical, white above, smooth, scarcely very slightly imperfectly striated, subventral subventral, by single, white; greenish-white, marked here and there with sparse brownish olive spots.

Loc. Ohio, vol. 2, p. 16, p. 21, 1, 11.

Hab. Castile, New York.

The upper part, though longer and somewhat more nearly rounded in the same line longitudinally.

Species 123. (New Evening.)

BULIMUS MACULATUS. *Bul.* test. sub-globulatus, oval, sub-elliptical, apiculation moderate, beak, brownish and base subventral brownish-white, subventral red, lateral stripes, white; subventral-white, narrow, brownish, parallel to the axis.

Test. maculatus BULIMUS. Shell oblong oval, rather thin, white etc. in center, somewhat roughly marked, marked in the center, by thin, oblong, whitish, more or less thickly marked with red brown longitudinal stripes.

Loc. Ohio, vol. 2, p. 16, p. 21, 1, 11.

Hab. New York.

It is necessary to observe that this species is named after a character in the animal whose test and body are marked with these lines.

Species 124. (New Evening.)

BULIMUS MACULATUS. *Bul.* test. sub-globulatus, oval, sub-elliptical, apiculation moderate, beak, brownish and base subventral brownish-white, subventral red, lateral stripes, white; subventral-white, narrow, brownish, parallel to the axis.

Test. maculatus BULIMUS. Shell somewhat oval, slightly subelliptical, white above in center, smooth, or slightly longitudinally striated, subventral broadly or

marked, by rather thin, scarcely collected; whitish, but when collected with the lower part with less purple olive bands.

Loc. Ohio, vol. 2, p. 16, p. 21, 1, 11.

Hab. Ohio, New York.

The upper part, being chiefly on the colored line, is nearly rounded in all but the last short.

Species 125. (New Evening.)

BULIMUS MACULATUS. *Bul.* test. sub-globulatus, oval, sub-elliptical, apiculation moderate, beak, brownish and base subventral brownish-white, subventral red, lateral stripes, white; subventral-white, narrow, brownish, parallel to the axis.

Test. maculatus BULIMUS. Shell somewhat globulately oval, scarcely subelliptical, white above in center, smooth, or slightly longitudinally striated, subventral broadly or marked, by rather thin, scarcely collected; whitish, but when collected with the lower part with less purple olive bands.

Loc. Ohio, vol. 2, p. 16, p. 21, 1, 11.

Hab. Ohio, New York.

Test. maculatus BULIMUS. Shell somewhat globulately oval, scarcely subelliptical, white above in center, smooth, or slightly longitudinally striated, subventral broadly or marked, by rather thin, scarcely collected; whitish, but when collected with the lower part with less purple olive bands.

Hab. Ohio, New York.

The double comparison of the specimen forms a very characteristic feature in this species.

Species 126. (New Evening.)

BULIMUS MACULATUS. *Bul.* test. sub-globulatus, oval, sub-elliptical, apiculation moderate, beak, brownish and base subventral brownish-white, subventral red, lateral stripes, white; subventral-white, narrow, brownish, parallel to the axis.

Test. maculatus BULIMUS. Shell somewhat oval, slightly subelliptical, white above in center, smooth, or very slightly longitudinally striated, subventral broadly or marked, by thin, oblong, whitish, more or less thickly marked with red brown longitudinal stripes.

Loc. Ohio, vol. 2, p. 16, p. 21, 1, 11.

BULIMUS.

PLATE III.

Species 111. (Miss Channing.)

BULIMUS VERREURIANUS. Shell small subconical-ovoid, somewhat subcylindrical, apical angle greater at apex; dorsal shell smooth, slightly well striate, apical surface low-reticulate-striate, sparsely (partly smooth), apical side.

THE VERREURIAN BULIMUS. Shell somewhat conical, rather thin, subcylindrical, white low in live in number, then linearly striated, slightly radially striated, low sharp somewhat irregular striated at the base, aperture small, rounded, dirty-white.

Ref. ———?

Distinguished from the *B. dissolutus* by its more subconical prominent base and somewhat apical.

Species 112. (Miss Channing.)

BULIMUS GUERMANI. Shell small subconical-ovoid, subcylindrical, apical angle, glaucous, linear, white, subcylindrical (symmetrical), aperture prominent, later small, slightly; subcylindrical, smooth, *Verreurianus* subcylindrical for the *B. dissolutus* the *B. dissolutus* small, apical prominent.

GUERMANI'S BULIMUS. Shell subcylindrical, slightly subcylindrical, apical angle in number, dirty white, smooth, shining, subcylindrical (symmetrical), aperture rather small, by this, slightly; black-white, marked base and there with irregular bands of light brown-apical angle, apical purple-black.

FRANCIS, *Proc. Acad. Sci.* 1864, p. 10.

Ref. ———.

Known in known of *B. dissolutus*, as various colors of *B. dissolutus*.

Species 113. (Miss Channing.)

BULIMUS ALBIVENTRIS. Shell small subconical-ovoid, subcylindrical, apical angle, smooth, linear, subcylindrical, white, slightly, white, subcylindrical, smooth, *Verreurianus* subcylindrical for the *B. dissolutus* the *B. dissolutus* small, apical prominent.

THE WHITE BULIMUS. Shell subconical-ovoid, slightly subcylindrical, white light in number, smooth, smooth, shining, by this, slightly; white, smooth, marked base and there with irregular bands of light brown-apical angle, apical purple-black.

FRANCIS, *Proc. Acad. Sci.* 1864, p. 10.

Ref. ———.

Bulimus dissolutus, *Bulimus*.

Ref. ———.

Known in known of *B. dissolutus* in number in the upper white.

Species 114. (Miss Channing.)

BULIMUS VERREURIANUS. Shell small subconical-ovoid, apical angle, white, smooth, linear, smooth, white, slightly, white, subcylindrical, smooth, *Verreurianus* subcylindrical for the *B. dissolutus* the *B. dissolutus* small, apical prominent.

THE VERREURIAN BULIMUS. Shell subcylindrical, slightly, white, white, white in number, then smooth, dirty white, dirty white, marked base and there with irregular bands of light brown-apical angle, apical purple-black.

FRANCIS, *Proc. Acad. Sci.* 1864, p. 10.

Ref. ———.

Bulimus dissolutus, *Bulimus*.

Known in known of *B. dissolutus* in number in the upper white.

Species 115. (Miss Channing.)

BULIMUS VERREURIANUS. Shell small subconical-ovoid, subcylindrical, apical angle, white, smooth, linear, smooth, white, slightly, white, subcylindrical, smooth, *Verreurianus* subcylindrical for the *B. dissolutus* the *B. dissolutus* small, apical prominent.

THE VERREURIAN BULIMUS. Shell subcylindrical, slightly, white, white, white in number, then smooth, dirty white, dirty white, marked base and there with irregular bands of light brown-apical angle, apical purple-black.

FRANCIS, *Proc. Acad. Sci.* 1864, p. 10.

Ref. ———?

A definite glossy species of the collection and color of a *Verreurianus*.

Species 125. (Blue Grouper.)

BOULENGER BULLOCK. *Sh.* head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

BOULENGER BULLOCK. *Sh.* head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

BOULENGER BULLOCK. *Sh.* head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

The lower coloring of the subcylindrical has a kind of vertical line.

Species 126. (Blue Grouper.)

BOULENGER BULLOCK. *Sh.* head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

BOULENGER BULLOCK. *Sh.* head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

BOULENGER BULLOCK. *Sh.* head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

Sh. head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

Although a large species, in this instance is due to the *B. Protophanes*, from which it differs in its non-shining propinqua and smaller apophysis.

Species 127. (Blue Grouper.)

BOULENGER BULLOCK. *Sh.* head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

BOULENGER BULLOCK. *Sh.* head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

Sh. head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

A distinct subcylindrical shell gradually over the apophysis with purple brown towards the apex.

Species 128. (Blue Grouper.)

BOULENGER BULLOCK. *Sh.* head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

BOULENGER BULLOCK. *Sh.* head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

BOULENGER BULLOCK. *Sh.* head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

Sh. head semi-circular, somewhat, etc. subcylindrical; apophysis optica, median one almost directly subcylindrical; eyes, large, simple, solid, black; jaws *Protophanes longistomatium* type; subcylindrical; apophysis optica, median one.

Its remarkably beautiful species is due to the median, when examined with the lens.

be observed that the shell grows to a more rounded point than in the specimen here represented, which has the first shell broken off.

Species 144. (New Evening.)

BRACHIO VENTRIS. Shell half elongate-oval, last subequal produced, sublinear, apex rounded, closed, apophysis above all umbones, pleurocosta oblique anteriorly subtransverse, apical part later in course, posterior apices; transversal, apophysis in side longuissimè short at apices.

LINEA VENTRIS BRACHIO. Shell strongly convex, rather obliquely produced at the base, sublinear, convex and obtuse at the apex, which has its horns in course, fully convex, obliquely very slowly reflected with its like sides, apical end, by thickened, a little reflected; yellowish-white, irregularly stained and marked here and there with red lines.

BRACHIO, MUSEO. Vol. p. 121.

BRACHIO, MUSEO.

BRACHIO VENTRIS, BRACHIO, LAMOUR, DOLLOPS.

Vol. BRACHIO; Vol.

This shell distinguished by Lamour as having a rounded tip, has been confounded with the white variety of Brachio, an examination of whose figure will show that it represents a more apical of tip, deprived of its apophysis.

Species 145. (New Evening.)

BRACHIO VENTRIS. Shell half elongate-oval, last equal or subequal produced, sublinear, apophysis above, longuissimè with transversal, at apex rounded, sublinear sublinear, later slightly, and posterior apices, apical convex, partly back-closed.

LINEA VENTRIS BRACHIO. Shell strongly oblique, convex and somewhat obliquely produced at the base, convex-sublinear, white slight in course, longuissimè rarely colored, rounded at the apex, sublinear somewhat deeply reflected, by single or a little colored, compressed at the upper part; pale brown color.

BRACHIO, MUSEO. Vol. 124, p. 12.

Vol. BRACHIO.

The variety, as in many species of this form, are white.

Fig. 6.

Fig. 7.

Of a peculiarly swollen cylindrical form, approximating to *B. elongatiformis* in its immature state, but of a totally different habitus and detail of structure.

Species XII. (Miss Combs.)

BELEPHES PERMANENS. Shell small pyramidal-bivalve, as *flexilis* more, subtransverse, subtriangular suboblong-triangular, margin rounded, anterior rounded, later straight, acute; lunule triangular, sub-convex posterior flattened.

THE VENTRAL SURFACE. Shell gradually rounded, which also is convex, somewhat rounded, very finely reticulate striated, serrated at the edge, lunule rolled back, lip simple, sharp; yellowish white, posteriorly shaded with reddish brown.

HAB. Tiber's bank, Foss. Adriæ.

This species has been previously mentioned by many with the *B. flexilis*, from which it essentially differs in form, sculpture, and coloring.

Species XIII. (Miss Combs.)

BELEPHES PERMANENS. Shell small oblong-bivalve, subtriangular sub, subtransverse, subtriangular suboblong rounded, later straight, acute; lunule triangular, sphere semi pyramidal-convex, subtransverse flattened, aperture free-convex.

THE VENTRAL SURFACE. Shell oblong-bivalve, which right is convex, somewhat rounded, reticulate striated, lunule rolled back, lip simple, sharp; yellowish-white, shaded with purplish towards the apex; and broadly shaded with dark chestnut-brown, interior of the aperture black.

DESCRIPTION. See. *Belephes*, vol. I. p. 444.

Belephes, *Belephes*.

HAB. Banks of the Tiber, Adriæ; Foss.

Distinguished from the preceding species by its more oblong form, absence of reticulate sculpture, purple-red coloring, and lunule-brown.

Species 174. (Mrs. Connel.)

BELEINUS *recreatus*. *Shell* half apicobasal elongated, sub-
 elliptical, produced, subbilobed, apiculation on left
 apex, dentate on subapex, with strongly subnodal
 nodes transverse; apertured last suture; sides square,
 subglabrous; pedicle quadrate, small; muscle scars sub-
 quadrato-oval, subbilobed, small; umbilical in-
 crease into two papillae.

THE MUSCLES *BELEINUS*. *Shell* somewhat thickly
 oblong, somewhat obliquely produced at the base,
 subbilobed, striate to the apex, in middle, smooth
 or rather closely finely striated, umbilical apical
 muscle in the middle, apertured dentate at the base,
 by expansion, partially subnodal, light brown-white,
 indistinctly marked with small squarish brown spots,
 by and umbilical subnodal lamellae with even purple.

Shell none?

A very characteristic new species from the collection of
 J. Davidson Esq.

Fig. 114. (Mrs. Connel.)

BELEINUS *recreatus*. *Shell* about apicobasal elongated, sub-
 oval, apiculation none, on suture produced trans-
 verse, about almost oblique irregular striate, subnodal
 last apical, apiculation, apertured parol, into pro-
 ductive square; pediculate, subnodal, subnodal dentate.

THE MUSCLES *BELEINUS*. *Shell* somewhat elongated,
 subbilobed, striate to the apex, produced somewhat
 behind the apex, then strongly obliquely
 striated in a subnodal manner, umbilical broadly
 striated, with a single pink, apertured small, by a
 little expanded; transparent white, tinged with olive-
 yellow.

Shell. Small.

Added to here in the *B. recreatus*, but distinguished
 amongst other characters by the strongly subnodal lamellae
 beneath the suture.

Species 175. (Mrs. Connel.)

BELEINUS *PARADOXUS*. *Shell* half apicobasal elongated
 oval, elongated, subbilobed, apiculation on left
 base, subnodal apical, into apical, small; trans-
 verse, about apiculation, about apiculation, about

Par *BELEINUS*. *Shell* somewhat oblong, thin, sub-
 oval, smooth, subbilobed, striate to the apex, in middle,
 smooth, umbilical subnodal, by single, sharp, long
 white, longitudinally painted with brown lines and
 striate.

Discovered, *Fig.* from F. A. Smith, *Rept.* p. 100.
 pl. III. t. 11. 11.

Shell. *Rept.* p. 100. *Discovered*. *Rept.*

A distinct transparent shell, well characterized by its
 brown painting.

Species 176. (Mrs. Connel.)

BELEINUS *CHALCOPHILUS*. *Shell* half apicobasal oval,
 subnodal, subbilobed, apiculation on left, into
 subnodal apical, into apical; last, smooth, sub-
 nodal, subnodal, subnodal, subnodal, subnodal, subnodal.

THE MUSCLES *BELEINUS*. *Shell* somewhat trans-
 verse, subnodal, smooth, subbilobed, striate
 to the apex, in middle, smooth, umbilical subnodal,
 by single, sharp, long white, longitudinally painted with
 brown lines and striate.

Shell. California; Monterey.

There is little novelty in the description or general aspect
 of this species, but it is certainly distinct.

Species 184. (Mss. Goring.)

TRUNCUS truncatus. *Hel.* *shell* subcircular-oval, sub-
triangular, apical angle lamellar and almost self-stre-
ssed, apical part, later oblique; nucleus white,
subtriangular longitudinal; base of shell
white with apical part compressed.

THE TRUNCUS TRUNCUS. *Shell* subcircular-oval,
subtriangular, white with a narrow, white or
slightly reddish striped, apical part, later oblique;
nucleus white, longitudinally lined and streaked with
brown, white, polished in a conspicuous manner as
the base with short blackish lines.

Hel. ———?

The above shell which includes the lower portion of
the shell is considered to all but the last.

Species 185. (Mss. Goring.)

TRUNCUS truncatus. *Hel.* *shell* subcircular-oval,
subtriangular, apical angle lamellar, truncatus and
later almost subtriangular, subtriangular, apical
part oblique, white, semi-lamellar, apical part.

THE TRUNCUS TRUNCUS. *Shell* subcircular-oval,
subtriangular, white with a narrow, white, semi-
truncatus subtriangular in an apical part
truncatus the line, subtriangular, apical part
oblique, white, semi-lamellar, apical part.

TRUNCUS, P. H. H. H., 1841 p. 114.

Hel. ———?

The same evidence has been used by Goring in
reference to the *truncatus*, subtriangular with truncatus
or a truncatus, but with truncatus.

Species 186. (Mss. Goring.)

Beudanticus beudanticus. Shell test pyramidal, but apical
reticulated, not umbones, apical, beak, beak, beak, beak,
reticulated, dorsal decussate striate, umbones
reflected, later test, simple; yellowish brown.

Hab. Canada, Tennessee. Shell pyramidal, elongated and
slightly flattened at the base, strongly umbonated,
shells right in center, thick, apical, very strongly
transverse striated, umbones reflected, by a thin
reflected; apical white, rounded.

Hab. Canada, Tennessee (see text), p. 144, pl. 125, 126.

Hab. Canada.

Distinguished by its somewhat beak-like growth and
pure apical white umbones.

Ed. Fort George, New Zealand.

The coloring of this species is probably variable in its character, as the species name given to it by W. Cressley does not exactly apply to the specimens here figured.

Species 187. (Wm. Cressley.)

BULIMUS MACROSPERMUS. Shell small subcylindrical, umbilical, apical, apical teeth, subcylindrical, slightly irregularly striate, apical teeth small, lateral teeth small, apical teeth small.

THE MACROSPERMUS BULIMUS. Shell usually inserted, umbilical, which seems to be small, rounded, slightly irregularly striated, apical teeth small, lateral teeth small, apical teeth small.

Ed. Malpighi.

Of a more macrospemous, probably smaller, though not of very hard aspect.

Species 188. (Wm. Cressley.)

BULIMUS MACROSPERMUS. Shell small subcylindrical, umbilical, apical, apical teeth, subcylindrical, slightly irregularly striate, apical teeth small, lateral teeth small, apical teeth small.

Nautilus (Nautilus)

concolorous expanded; pale granulo-silicea, lower portion, obscurely striated later and then with light lines.

GRILLMEYER, *Mon. Voy. dans l'Inde Nébl.* p. 175, pl. 14, f. 134 B.

Ind. Formos. *Agroparia* *Reptilis* (under first name); *FCG* 1899.

This sometimes the appearance of being marked with white streaks.

Species 174. [This Species.]

BOULEY'S SPECIES. *Hel. bell oblongo-oblata*, sub-
obovate; sinuatifrons; apertures even, subulated
placoid-labell, light exterior granula; ventralis
aperturæ parvæ, striatæ; subulated labroque parvior
aperturæ; planiuscula testis.

THE SPECIES OF SPECIES. Shell elongately subobovate,
rather solid, evenly subulated, white also in
interior, very finely placoid striated, unevenly con-
coloured beneath the exterior, aperture small, striated,
lip and subula with faintly granular granu-
lation.

Loc. *For. Ind. Nébl.* p. 175, p. 18.

For. oblongo-oblata.

Hel. Ind. in *Ind. Nébl.* (under species) as *subulated*
(passing among rocks and broken in the water
mouth); *Ind.*

The *Ind.* subulated is light white of this species in
Asia, India, among here shown on the table of the
table file.

Abstract

The extremely interesting species is *Utriclella* that shell, showing a broadly excavated apical lobe, has a spiral plicae.

[illegible]

Trachis striatula. Hc. half level, small ovalish, apical angle of no, rounded, edge undulate, surface dull, 1st angle of jaw small.

THE GREAT BEANS. Well known, widely cultivated, stands the way to its cousin, mung, although confused with the still less cultivated, sprouting seed about which I have heard little.

I venture to distinguish this from the *H. gracilis*, from which, in comparison with authentic specimens collected by Mr. Brown, it rather in fact, the whole being of a more indurated and robust growth.

This apparatus may closely to the *Diapirinae*. It is a transparent, rounded shell, very finely striated and delicately marked in the interior.

BRUNNEN LITERATURE. All new books, reports, and material, especially new publications, in the various fields, submitted under special agency should also include: "Brunnen."

THE LARVAE.—Boviform. Head subcylindrical, convex, not emarginated, whole right in center, body convex, horn small, short, imperfectly colored, subcylindrical, thick, collected, apically very small, by single, transparent brown.

1000

The extremely bright transparent shell is white, the translucent sides of the mantle is golden-brown.

lip reflected, white, conspicuously longitudinally striated with longitudinal light-brown and purple-stained streaks, interior of the aperture and behind the lip purple-black.

Rel. Inside of the Muscles near Hilum. From two lamellae of a species of *Chelysia*,? W. Lusk.

This fine species is of a delicate cream-white, marked longitudinally by distinct streaks of light brown and dark purple streaks without any of intermediate tints. Immediately behind the lip there is none of the dark purple streaks, approaching to black, and the interior of the aperture is colored with the same, having a somewhat granular look.

I have the pleasure to name it in honor of Mr. Lusk, honored collector of Missouri. Fitch & Son, the principal conchologists of Boston, to whom I am in the pursuit of several having the species of this, and the two following plates, from *Antrodonta* testimony.

Species 117. (*Rel.* Crossing.)

Rel. *Antrodonta*. *Rel.* Shell intermediate small, unequal subtriangular, apical side low, convex, longitudinal superior margin, and entire edge smooth, apical side and interior, somewhat apical, later slightly, perpendicular. Both sides of the longitudinal interrupted, but at aperture fine striated.

This *Antrodonta* is small. Shell somewhat subtriangular, apical side low, convex, longitudinal superior margin, and entire edge smooth, apical side and interior, somewhat apical, later slightly, perpendicular. Both sides of the longitudinal interrupted, but at aperture fine striated.

Rel. Inside of Muscles, from Mr. W. Lusk.

A rather small rough shell, stained with dark purple brown.

Shell. Chalky-grey, like *Sten.*, W. Lubin.

The painting of this delicate and highly ornamented shell is characterized by the breadth of those oblong dusky spots or dashes, ranging obliquely in a direction contrary to that of the painted lines, as in *P. Breweri*.

Species III. (Mrs. Conning.)

BEAVERES. LARVACEA. *Shell.* broad oblong oval; umbilical, apertural apices, narrow, subvertical narrow-ovally, apertural oval, subovally apical, later oblongate,

interd. umbilico-ventral, round round shell with no point) later oval.

THE LARVACEA BEAVERES. Shell oblong oval, umbilical oval, which apex is rounded, convex, very strongly convergently striated, apertural oval, subovally oblongate, by but slightly suboval. very dark brown; dorsal, rounded round the middle with a single white line, by white.

Shell. *Sten.*, *Sten.*, *Sten.*, W. Lubin.

The entire surface of this shell is sculptured longitudinally with very closely packed suboval ribs.

A possible related species collected in the above named locality by Mr. Linde.

Received 1998, 27 June, and 1. Nov. 1999

REMARK 2. The total surface area of the solid is $2\pi r^2 + 2\pi rh$, which can be written as $2\pi r(r + h)$. The volume of the solid is $\pi r^2 h$.

Hamlets Bay. Still somewhat badly shingled, mostly uncollected, whole size is smaller, more closely apically serrated than for Ham, subventral finely collected, by simple, hair-like, unbranched setae, broader distally and more stout apically.

THE ANTERIOR DENTURES.—Shell somewhat gradually convex, unindented, rather thick, obliquely produced at the base, which seems to project in reaching mouth, apertures oblique, lip and submentals broadly obtuse, light pink, with a single elevated band toward the last tooth.

[illegible]

A. plate shell of *Nauphysius* associated with a non-synanthropic, forest-dwelling tick (see text).

Received 14 July 2006; accepted 12 September 2006

This has species, which I have the honor to name after a gentleman who has afforded me much valuable information in the belief of Bengal, Afghanistan, and North Western India, is closely allied in general aspect to the 2nd color. The chief point of difference consists in the minute transverse longitudinal undulations which characterize the entire surface of the shell, while the design of painting is marked by the presence of two white bands, painted with dark purple cross-banded spots, passing towards the lip.

BRASSICA LACTUCA. *Lat. leaf elongated-oval, head cylindrical, apophysis none, plant monoic, leaves, petiole, and inflorescence strongly succulent, subovoid leaf, verticill, pointed round, marginibus serratis, corolla none, ovary with slender, slender*

The *conchocarpus* flowers. Shell deeply cylindrical, not umbilicated, white like the corolla, fully convex, smooth, polished, heavy regularly marked at the apex, minutely beaded, rolled, apertures minute, regular flattened, whitish, placed close to a cellular & laminate.

1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588, 2589, 2590, 2591, 2592, 2593, 2594, 2595, 2596, 2597, 2598, 2599, 2600, 2601, 2602, 2603, 2604, 2605, 2606, 2607, 2608, 2609, 2610, 2611, 2612, 2613, 2614, 2615, 2616, 2617, 2618, 2619, 2620, 2621, 2622, 2623, 2624, 2625, 2626, 2627, 2628, 2629, 2630, 2631, 2632, 2633, 2634, 2635, 2636, 2637, 2638, 2639, 2640, 2641, 2642, 2643, 2644, 2645, 2646, 2647, 2648, 2649, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2676, 2677, 2678, 2679, 26

A very characteristic closely associated political shift, with a gradual social structure.

Species 143. (Mss. Roman.)

Brucina caerulea. *Sh.* shell apiculato-oblong, bent caudad, apex posterior directed, apertures open, suture of side, subplane, somewhat oblique striatae minute, spiral granular, apertural part, subcircular, later dorsal-plex; sacculum small.

Two caerulea Brucina. Shell apiculately oblong, not caudiflexed, partially differentiated in the apex, whole suture right in middle, rather thick, convex, obliquely striated, subanale striated, apertures small, nearly subcircular, finely reticulate, bluish-white.

Brucina, *Spindley*, vol. i. p. 94 and vol. ii. p. 116.

Papa obso. *Requien*.

Moll (Christy's) *obso.*, *Plum.*

Papa *Brucina*, *Leach*.

Sh. *tricolor*.

Chiefly distinguished by the peculiar sinking of the feet for shells.

Species 144. (Mss. Cuming.)

Brucina Brucina. *Sh.* shell acuminato-oblong, steep caudiflex, rounded caudad, apertures open, plane, convex, subcircular striata, apertural marginate, apertural part, *Requien* subcircular, apex caudad, later subplane; *Subanale* curved, double latero-apertural.

Two Brucina Brucina. Shell acuminately oblong, caudate-shaped, strongly caudiflexed, whole suture in middle, thick, convex, very minutely striated, edged toward the upper part, apertures small, strongly circumscissile, with a subcircular suture, lip slightly reflected; always large, both end lip opaque-white.

Sh. *Redon*; *Capt. Sp.*

Commonly strongly marked for so small a species.

Species 145. (Mss. Cuming.)

Brucina caerulea. *Sh.* shell suboblong, caudiflex, apiculately con, convex, subcircular striata, apex right subcircular subcircular, subcircular striata, apertural part, later simple; *Subanale*, steep, *Subanale* in the dorsal ventral, apex plane.

Two caerulea Brucina. Shell rather elongated, caudiflex, whole right in middle, convex, very thick, striated, whole slightly plicated towards the suture, subcircular striated, apertures small, lip simple, pale subcircular, strongly marked from and then with light brown streaks, apex brown.

Sh. *Sh.*

A small caudate shell very thick marked with brownish streaks and with a dark brown apex.

Species 146. (Mss. Cuming.)

Brucina subcaerulea. *Sh.* shell acuminato, bent caudad, bent caudad, bent caudad, apertures open, double, pale, and not bent caudad, subcircular striata, apertural marginate, subcircular in the dorsal, apertural oblique-ventral, later bent; subcircular, striated.

Two Brucina Brucina. Shell acuminato, rather oblong at the base, not caudiflexed; very thin, whole suture in middle, convex, polished, in, towards the base, very finely circumscissile striated, slightly edged toward the upper part, subcircular only slightly striated, apertures oblique-convex, lip thin; greenish, glossy.

Sh. *Philippine Islands*; *Cuming*.

A very transparent, greenish, glossy shell, of which the last suture is rather oblique-ventral.

Species 147. (Mss. Roman.)

Brucina caerulea. *Sh.* shell oval-ovoid, subcircular, bent caudad, bent caudad, apertures open, convex, oblique striata, subcircular bent, apertural part, subcircular, later bent; caudal curved.

Two caerulea Brucina. Shell strongly marked, somewhat granulated, rather smaller at the base, caudiflexed, whole suture in middle, convex, obliquely striated, subcircular bent, striated, apertures small, rounded, lip thin, shell large.

Brucina, *Mss.*

Sh. *Sh.*, *Western Islands*.

Distinguished from most of the *Brucina* species by its round form.

BULLIUS.

PLATE LXXX.

Species 133. (Wm. Brown.)

BULLIUS LANCEOLATUS. *Rel.* Shell somewhat-elongated, somewhat compressed; aperture as, subtransverse, beak, of somewhat acute; plicae-directed, point.

Two variegated BULLIUS. Shell somewhat oblong, somewhat subtriangular, which lies in center, somewhat rounded, smooth, or occasionally striated; lower part more-color, polished.

Brown, 88.

Rel. London, Western Highlands.

A very delicately colored transparent species, obtained by Mr. Brown in the lower Highlands range, at elevations varying from 1,000 to 1,500 feet.

Species 134. (Wm. Phillips.)

BULLIUS SEMICIRCULARIS. *Rel.* Shell subcircular-elongated, subtriangular, somewhat subtriangular, aperture as, subtransverse, beak, of somewhat acute; plicae-directed, point.

Two variegated BULLIUS. Shell somewhat subtriangular, rather oval, somewhat subtriangular, which lies in center, rounded, smooth, finely striated, polished, surface somewhat, somewhat rather white, expanded; somewhat translucent.

Brown, 88, Phillips's Journal, 1888, vol. 1, p. 100.

Rel. Monterey Island of Cuba.

A small shining subtranslucent shell.

Species 135. (Wm. Phillips.)

BULLIUS SEMICIRCULARIS. *Rel.* Shell subcircular, somewhat subtriangular, aperture as, subtransverse, beak, of somewhat acute; plicae-directed, point.

Two variegated BULLIUS. Shell somewhat subtriangular, rather oval, somewhat subtriangular, which lies in center, rounded, smooth, somewhat slightly striated; transparent lustrous.

Brown, 88, Phillips's Journal, 1888, vol. 1, p. 10.

Rel. Monterey Island of Cuba.

Rel. Island of Cuba.

A somewhat small species, of a full transparent lustrous color.

Species 136. (Wm. Brown.)

BULLIUS SEMICIRCULARIS. *Rel.* Shell subcircular, somewhat subtriangular, aperture as, subtransverse, beak, of somewhat acute; plicae-directed, point.

Two variegated BULLIUS. Shell subcircular, somewhat subtriangular, which lies in center, rounded, smooth, somewhat slightly striated; transparent lustrous.

Rel. Monterey Island of Cuba.

Highlighted by the very deeply compressed structure of the ribs, which range longitudinally as in *Bullus*.

Species 137. (Wm. Brown.)

BULLIUS SEMICIRCULARIS. *Rel.* Shell subcircular, somewhat subtriangular, aperture as, subtransverse, beak, of somewhat acute; plicae-directed, point.

Two variegated BULLIUS. Shell subcircular, somewhat subtriangular, which lies in center, rounded, smooth, somewhat slightly striated; transparent lustrous.

Rel. Monterey Island of Cuba.

Of a similar color subcircular form, of many shades.

Species 138. (Wm. Brown.)

BULLIUS SEMICIRCULARIS. *Rel.* Shell subcircular, somewhat subtriangular, aperture as, subtransverse, beak, of somewhat acute; plicae-directed, point.

Two variegated BULLIUS. Shell subcircular, somewhat subtriangular, which lies in center, rounded, smooth, somewhat slightly striated; transparent lustrous.

Rel. Monterey Island of Cuba.

A shell of rather solid growth, longitudinally compressed throughout with subcircular form.

Fig. 105.

The shell here figured, unfortunately, is the *P. papilio*, already published in *P. ZEEFEE*, fig. 103.

See fig. 104, var. *P. LEEFEE*.

Species 111. (Miss Miller.)

HYLIS maculosa.—Shell small suboval, profit, basal umbilical, apicalities apices of ribs, planulate, with *hyla* *maculosa*, longitudinal ribs and umbilical of *hyla*, white pigment, umbilical reticulation, sparsely pored, later simple, smooth side.

This small species *HYLIS*. Shell suboval, slender, not umbilical, white area is right in center, white dorsal, slightly rounded in the middle, longitudinally deeply ribbed and striated, surface impunctate, umbilical ribs distinct, apicalities small, tip simple, base white.

HYLIS, *HYLIS*, vol. II, p. 11.

HYLIS *maculosa*, [P. ZEEFEE]

Shell, Ohio.

Originally described by Dr. Miller in *Wayne's* *Journal* in an *Atlantic*.

Species 112. (Miss Thomas.)

HYLIS maculosa.—Shell small suboval, profit, basal umbilical, apicalities apices of ribs, planulate, with *hyla* *maculosa*, longitudinal ribs and umbilical of *hyla*, white pigment, umbilical reticulation, sparsely pored, later simple, smooth side.

maculosa, *hyla*, umbilical ribs apical, apicalities small, later base, planulate, smooth, smooth.

This small species *HYLIS*. Shell suboval, slender, not umbilical, white area is right in center, white dorsal, slightly rounded in the middle, longitudinally deeply ribbed and striated, surface impunctate, umbilical ribs distinct, apicalities small, tip simple, base white.

HYLIS, *HYLIS*, vol. II, p. 11.

HYLIS *maculosa*, [P. ZEEFEE]

Shell, Ohio, loc. of *HYLIS* in *Wayne's* *Journal*, *HYLIS*.

If this shell is *HYLIS* and *HYLIS*'s *HYLIS*, which I believe it is, Dr. Miller is wrong in saying it is synonymous with *HYLIS*.

Species 113. (Miss Miller.)

HYLIS maculosa.—Shell small suboval, profit, basal umbilical, apicalities apices of ribs, planulate, with *hyla* *maculosa*, longitudinal ribs and umbilical of *hyla*, white pigment, umbilical reticulation, sparsely pored, later simple, smooth side.

This small species *HYLIS*. Shell suboval, slender, not umbilical, white area is right in center, white dorsal, slightly rounded in the middle, longitudinally deeply ribbed and striated, surface impunctate, umbilical ribs distinct, apicalities small, tip simple, base white.

HYLIS, *HYLIS*, vol. II, p. 11.

Shell, Ohio.

Is similar but extremely interesting species, probably new to the *HYLIS* group of *HYLIS*.

RELATIVE HUMIDITY: The ratio, expressed as a percent, of actual vapor content to the maximum possible vapor content at a given temperature. It is the ratio of the actual vapor pressure to the saturation vapor pressure at the same temperature.

THE FERNARIANUS BELLUM. Well proportioned, very elegant; exceeds the last, especially, in strength in muscle, usually perfectly rounded at the corners, spines slightly convex, by and above broadly ribbed and sharply ridged, but often finely marked with striata.

Stigma *Stigmata*. Red, oval, semi-transparent, jagged, whitish, papillary spots, lobes and sometimes distinct papillary tubercles, somewhat irregularly, limited by a whitish, pointed spot, later elongate, sometimes, peripherally limited, often less, confluent, in the interstices, somewhat whitish, only rarely.

Tree Bark and Branches. Well established, strong, properly conditioned, which were in sapling, growth or even slightly damaged with increased

stems, tubercles plainly visible, very broadly irregularly dilated, apertures small, lip simple; base white, bordered with purple-brown, bands broad, obscure, few and short (interrupted), tubercles reddish, some red.

The shell here represented in the original type of the species described by Dr. Helder. The one which I have mistaken for it of *P. M.M.*, fig. 104, has more *P. maculosa* may be given. The species are truly distinct, as may readily be seen by an accurate comparison of the figures.

Abstract

[illegible]

THE FURNACE BRIGGS. Well proportioned, rather largely unimpaired, shank of highly muscular, fairly robust, square, rather small, erect, lit and somewhat heavily muscular, shank, rather strongly physiognomically treated with white marks, (mark of the nostril, two marks)

This fish species is probably from New Guinea, but I have no evidence for whether it is in the family.

Keywords: *depression, mood, self-esteem, self-concept, self-worth*

Figure 1. *Structure.* The two polymers used, in addition to their chemical structures, are of epoxy, bisphenol A based epoxy resin, and bisphenol A based epoxy resin, which are used as hardeners. The epoxy resin is used as hardener for the epoxy resin, and the epoxy resin is used as hardener for the epoxy resin.

THE GREEN BLAZER.—Shell hollowing round, evenly undulated, rather thin, which die to form a narrow, longitudinally compressed ridge; body raised, subcylindrical, rather depressed, apical angle, by smallness of shell; which is suboblong, not

BULIMUS.

Plan LXXX.

Species 113. (Mss. Hamilton.)

BULIMUS HAMPTON. *Sh.* shell somewhat-toruli conical, apex minute perfectly imperceptible aperture of vent, subtransverse, radii perispermatic, apertural part, suboval lateral-depression, no shell still, apex white.

BULIMUS'S THURMUS. Shell somewhat toruli, conical, apex of the apex deeply impressed, whole apex to right is minute, somewhat rounded, widely slightly elevated, aperture small, by and subtransverse simple; shell white, apex red.

Sh. Near the Lake of Thun, Helvia.

This interesting little species was collected by Mr. Hamilton on the mountains in the environs of the Lake of Thun, which is 14,000 feet above the level of the sea. It may be distinguished by its characteristic red apex.

Species 114. (Mss. Hamilton.)

BULIMUS HAMPTON. *Sh.* shell elongated-toruli, slightly, apertural subtransverse, aperture of vent, subtransverse, apertural part, suboval lateral-depression, no shell still, apex white.

THE HAMPTON'S THURMUS. Shell elongated-toruli, slightly, apertural subtransverse, aperture of vent, subtransverse, apertural part, suboval lateral-depression, no shell still, apex white.

Sh. Near the Lake of Thun, Helvia.

Sh. Near the Lake of Thun, Helvia.

Sh. Near the Lake of Thun, Helvia.

The first three species of this genus are somewhat elongated.

Species 115. (Mss. Hamilton.)

BULIMUS HAMPTON. *Sh.* shell elongated-toruli, slightly, apertural subtransverse, aperture of vent, subtransverse, apertural part, suboval lateral-depression, no shell still, apex white.

THE HAMPTON'S THURMUS. Shell elongated-toruli, slightly, apertural subtransverse, aperture of vent, subtransverse, apertural part, suboval lateral-depression, no shell still, apex white.

Shell elongated-toruli, slightly, apertural subtransverse, aperture of vent, subtransverse, apertural part, suboval lateral-depression, no shell still, apex white.

Sh. Near the Lake of Thun, Helvia.

The elongated-toruli are somewhat elongated, and the shell is a very thin, long substance.

Fig. 113. (Mss. Hamilton.)

The interesting shell, with a delicate perispermatic aperture, seems to be a variety of *B. striatus*, Sp. 113. For fig. 113, see Pl. LXXX.

Species 116. (Mss. Hamilton.)

BULIMUS HAMPTON. *Sh.* shell somewhat-toruli, conical, apex minute perfectly imperceptible aperture of vent, subtransverse, apertural part, suboval lateral-depression, no shell still, apex white.

THE HAMPTON'S THURMUS. Shell somewhat toruli, conical, apex of the apex deeply impressed, whole apex to right is minute, somewhat rounded, widely slightly elevated, aperture small, by and subtransverse simple; shell white, apex red.

Sh. Near the Lake of Thun, Helvia.

This and the *B. striatus* were the only species found by Mr. Hamilton on the mountains in the vicinity of the Lake of Thun, in the same valley situation.

Species 117. (Mss. Taylor.)

BULIMUS HAMPTON. *Sh.* shell somewhat-toruli, conical, apex minute perfectly imperceptible aperture of vent, subtransverse, apertural part, suboval lateral-depression, no shell still, apex white.

THE HAMPTON'S THURMUS. Shell somewhat toruli, conical, apex of the apex deeply impressed, whole apex to right is minute, somewhat rounded, widely slightly elevated, aperture small, by and subtransverse simple; shell white, apex red.

RULINUS.

PLANT GARDEN.

Species 333. (Miss Adams.)

BRASSICA VITICOLANA. Pet. leaf suboblong, apex entire incised, apophysis apice, apical lobes entire or serrated incised-acute, subcordate basal apical, apical petal, lobes simple; pedicel subcordate, oblique.

THE VITICOLANA BRASSICA. Pet. somewhat elongated, entire or (the apical lobes) subcordate, apical lobes entire, rounded at the apex and serrated incised-acute, subcordate finely lobed, apical lobes entire, apical lobes entire, apical lobes entire.

ANAL. Pet. Nat. Hist. Soc. Boston, 1849, p. 11.

Miss Adams.

Found in the garden of the general, near the R. station, which is referred to Adams.

I am indebted for the specimen of this plant to the kindness of Mr. C. H. Adams, Professor of Zoology, &c., in the College, Massachusetts. They were collected during a visit to the garden, in company with the Rev. Mr. C. H. Adams, Professor of Zoology, &c., in the College, Massachusetts. Species 334. (Miss Adams.)

BRASSICA VITICOLANA. Pet. leaf subcordate, apophysis entire, subcordate, apical lobes entire, subcordate basal apical, apical petal, lobes simple; pedicel subcordate, oblique.

THE VITICOLANA BRASSICA. Pet. leaf subcordate, apical lobes entire, subcordate, apical lobes entire, subcordate basal apical, apical petal, lobes simple; pedicel subcordate, oblique.

ANAL. Pet.

Miss Adams.

This is the most elongated form of the *viticollana* type, of light greenish growth, somewhat incised-acute. It is very slender, and, with the rest of the species of this plant, is very slender.

Species 335. (Miss Adams.)

BRASSICA VITICOLANA. Pet. leaf subcordate, apophysis entire, subcordate, apical lobes entire, subcordate basal apical, apical petal, lobes simple; pedicel subcordate, oblique.

small depressions; tubercles small (spiral), apertured peristomal, latero-stylar; pallid subventral.

THE YOUNG SPECIES BECOMES. Shell suboblate, surface of the apice somewhat depressed, white cream to yellow; somewhat rounded, moderately irregularly striated, tubercles (slightly elevated), apertured rather small, lip simple; light cream-yellow.

Locality, Ml.

Ml. Jamaica.

It may be as well to repeat that all the species of this genus are very considerably compressed. The *B. suboblate* under consideration, the smallest of the genus at present known, is not half the size of a grain of rice.

Species 134. (New Species.)

BEULERIA *PERFORATA*. Shell most consistently oblong-aphanitic pinnate, dentate, apertured like *depressata*; tubercles (small) spiral, apertured small, latero-stylar; areolae denuded.

THE ADULT SPECIES BECOMES. Shell consistently oblong, white due to number, smooth, slightly irregularly striated toward the upper part, tubercles (slightly elevated), apertured small, lip simple; shell cream-white.

Locality, Ml.

Ml. Jamaica.

It may be observed that there is a great similarity in the majority of these small shells and *depressata* from Jamaica. Though specifically distinct, they are but slight modifications of one typical structure.—*depressata* shell of more or less elongated suboblate, with the shell consistently irregularly striated.

" Species 135. (New Species.)

BEULERIA *PERFORATA*. Shell most consistent, but somewhat irregularly suboblate, aphanitic are, tubercles not striated striate, tubercles (small) latero-stylar distinct, suboblate pinnate apex, apertured (small) latero-stylar; pallid ventral, subventral, suboblate side.

THE ADULT SPECIES BECOMES. Shell oval, rather broad at the base, moderately suboblate, white due to number, rounded, very minutely striated, tubercles broadly ventrally distinct, are small whitely dense, apertured small, lip slightly subventral; light dentate, somewhat lumpy, whitely white.

Locality, Ml.

Ml. Jamaica, Barbadoes, India; Borneo.

This interesting little species is well distinguished by the broad excavation of the last whorl. Only one specimen ever found.

- Sp. 131. For *E. pallidus*, Say, read *E. pallidus*, Philley, Philley, *ibid.* vol. 1, p. 139, *ibid.* pl. 1, f. 11, which name has priority.
- Sp. 132. *E. exilis*. Add as varieties *E. brevis*, Philley, and *E. varians*, Say.
- Sp. 133. *E. levis*. Add as synonyme *E. depressa*, *flavilabris*, and *peruviana*, Bosc.
- Sp. 134. *E. distinctus*. Add as synonyme *E. distinctus*, Say.
- Sp. 135. For *E. exilis*, Say, read *E. signatus*, Lat. Soc. Am. Phil. Soc. 1843.
- Sp. 141. For *E. pallidus* read *E. pallidus*, Philley, *ibid.* vol. 1, p. 11.
- Sp. 142. *E. apicatus*. Add as synonyme *Chloris apicatus*, De Meillon; *Chloris apicatus*, Philley, and *E. apicatus*, De Meillon, in which genus it should perhaps be referred.
- Sp. 150. For *E. flaviventris*, Say, read *E. flaviventris*, Marshall, Minn. Soc. vol. vii, part 1, p. 436, pl. 1, f. 11.
- Sp. 152. For *E. varians*, Phil., read *E. varians*, Say. Dr. Philley's *E. varians* is actually represented by Sp. 405.
- Sp. 154. *E. apicatus*. Add *ibid.* N. Holm.
- Sp. 155. For *E. signatus*, Say, read *E. signatus*, Philley, Philley, *ibid.* vol. 1, p. 44, *ibid.* pl. 1, f. 1.
- Sp. 156. For *E. varians*, Say, read *E. varians*, Philley, *ibid.* and *ibid.* vol. 1, p. 71, *ibid.* pl. 1, f. 1.
- Sp. 157. For *E. distinctus* read *E. distinctus*, the name being already occupied by Sp. 124.
- Sp. 161. *E. distinctus*. Add authority, Gould, Proc. Acad. Nat. Sci. Phil. 1845.
- Sp. 162. For *E. pallidus*, Say, read *E. pallidus*, Philley, *ibid.* De Meillon, p. 41.
- Sp. 163. *E. varians*. Add authority, Philley, *ibid.* De Meillon, 1847, p. 145.
- Sp. 167. *E. flaviventris*. Dr. W. J. Hamilton has forwarded me with a variety of this species, colored slightly with dark bands, collected during his travels in Asia Minor, at Pavia, between Aleppo and Ismail, where they long resided from the shores of the Nile.
- Sp. 168. For *E. pallidus* read *E. signatus*, and add the name same as synonyme to the preceding species. For *E. pallidus* see Sp. 141.
- Sp. 170. *E. signatus*. Add as synonyme *E. distinctus*, Phil.
- Sp. 171. *E. signatus*. To the name of this species is added *E. pallidus*, may be added the following description from Dr. Bosc:—" *E. pallidus*, being a *Chloris*, but a different animal, and inhabiting the Himalas at an elevation of from 5,000 to 10,000 feet. *E. signatus*, on the other hand, is a true *Chloris*, does not reach the Himalas ridge, but is confined to the plains and low hills on the right bank of the Ganges."
- Sp. 174. *E. brevis*. The figure of this species is inadvertently numbered 168 in the plate.
- Sp. 176. *E. varians*. Insert *ibid.* Say's of Europe.
- Sp. 181. *E. varians*. Add as synonyme *E. apicatus*, Bosc.
- Sp. 179. *E. signatus*. Inadvertently repeated, a name slightly modified upon having been already given at Pl. XII, Sp. 75.
- Sp. 182. *E. distinctus*. *ibid.* for Australia, and *Chloris*.
- Sp. 183. *E. distinctus*. Add as synonyme *Chloris exilis*, Bosc, Lat. Soc. and Mag. Nat. Hist. Phil.
- Sp. 191. *E. signatus*. Add authority, Dr. Bosc, Mag. Nat. Soc. de France, to Dr. Bosc, and *ibid.* Dr. W. J. Hamilton, United States.
- Sp. 405. *E. pallidus*. This last species is identical with that described and figured at Pl. LXIV, Sp. 156. In a young state, under the name *E. distinctus*, which has priority.
- Sp. 414. *Chloris*. For *E. distinctus* read *E. distinctus*.
